(b.) Generalized Dermatitis: Patients with generalized dermatitis were directed to a supply of all cotton pajamas, gloves and socks, to be boiled in plain water and dried. A bath was taken to which had been added 2 cups of oatmeal or cream of wheat boiled to make a gruel which served to free the skin of irritants and

promote drainage. Often a colloidal clay lotion was prescribed to satisfy the "put something on it impulse." The skin was kept incased in cotton until exfoliation occurred. Scratching was permitted. A diet high in calories was advocated, with hourly feeding for those patients with severe symptoms. We have found that a full stomach controls cutaneous symptoms better than sedatives or antipruritics. The routine laboratory examinations often showed a need for iron which was prescribed for many of these patients.

The success in the care and management, especially of the patients with acute overtreatment complications,

Fig. 1.—Cresol intoxication, with the primary overtreatment reaction on the chin and the secondary manifestation, toxic or sensitization ids.

has instilled into us a deep respect for the healing and regenerative powers of the skin, a remarkable ability to recover from the severest of insults. Opening the pajamas, peering under the gloves, socks and dressings taught us the value of splinting the skin, the immobilization of it in the healing process. To us, scabs, dried crusts and scales are natural splints, and these were not molested, nor were pustules or bullae opened. We believe that an error has long been made of giving a dermatologic remedy credit instead of recognizing the inherent healing capacity of the skin.

B. SECONDARY MANIFESTATIONS OF THE PRIMARY OVERTREATMENT REACTION

1. *Toxic or Sensitization "Ids."*—The ids were observed at either of two stages of the primary overtreatment reaction, the drainage phase or the drying phase. Sudden and intense pruritus generalized in character usually preceded their appearance. The atopic skin areas seemed especially predisposed. They appeared as showers of vesicles; some were evanescent, whereas others were more persistent with associated erythema which soon changed into a patchy dermatitis. The palms and soles always participated, but here the vesicles were deep seated. The toxic ids were observed in 39 patients. The reactions to past treatment patch tests were violent; each case displayed a flare type. A skin with an id

reaction is the most irritable skin that we have observed. All the patients reacted to one or more of the single ring organic mercurials, 4 patients to a proprietary containing ethyl aminobenzoate and hexylm-cresol and 7 to proprietaries containing phenol or cresols.

REPORT OF A TYPICAL CASE.—P. G., was a white farm girl, aged 14, who had had attacks of Rhus dermatitis for eight summers. After helping her father repair a fence, she noticed that her chin itched. It became red, and soon little water blisters appeared. In the family medicine chest were remedies good for itching and healing. The mother applied "unguentine"; no relief, so petroleum, without relief. Then "wonder salve" was tried, and finally her father remembered an old prescription in the garage that had cured his toe itch. This too was applied. A few days of this treatment and the chin looked worse. It oozed a yellowish serum which was diagnosed by the family as impetigo; infection had finally set in. A neighbor, learning of this, hastened to advise a remedy that was a sure cure. All one had to do was follow the directions on the label, 1 teaspoonful of "sheep-dip" to a pint of water, then bathe the affected parts freely. The mother did this, sopping it on plentifully to make sure that the terrible germs were killed. Instead of getting better,

Fig. 2.—Appearance twenty days later, after care and management. the chin wept profusely; so it was bathed again. By the next morning, it was dripping a watery fluid; and to the horror of the family, the girl had broken out all over (fig. 1). The chin shows the primary cutaneous overtreatment reaction. Here the skin had been actually cooked. The toxic ids were present as superficial, discrete, noninflammatory vesicles; others were grouped, became erythematous, then pustular with final crusting. This patient could not open her mouth; her eyes were sealed shut. The uninvolved skin showed a light olive green color which we consider a sign of systemic intoxication, a mild shock-like state. The legs and feet were free of lesions.

The rectal temperature was 101 F. Lymph nodes were palpable in the anterior cervical region and in the axillas. The reflexes were hyperactive. A physical examination was otherwise not unusual in result. The blood pressure was 100 systolic and 60 diastolic, the pulse rate 125, the hemoglobin 12 Gm., the red blood cells 4,500,000, the leukocytes 19,500 and the differential count not remarkable. The urine showed an albumin (2 plus) with 50 leukocytes per low power field.

A diagnosis of cresol intoxication was made. Aside from the usual supportive care, the management of the skin centered about the promotion of drainage of the chin area and protection for the rest of the skin. Patch tests were done ten days later. All the remedies used elicited negative reactions except an organic mercurial (1 plus) and the "sheep-dip," which in the recommended dilution caused vesicles and pustules at the testing site. Within twenty-four hours the chin showed erythema, and showers of vesicles appeared on the legs and soles. It required twenty days for this patient to get well; at which time figure 2 was taken. The label on the "sheep-dip" said it was good for man and beast.

2. *Toxic Lymphangitis with Adenopathy.*—The inclusion of these 16 patients, all of whom had been referred, as examples of therapeutic chemical intoxication was decided on when past therapies seemingly had failed. Penicillin had been administered in 8 cases, 1 patient receiving a total of 3,000,000 units. There were 2 patients receiving penicillin at the time of consultation. The remaining 6 had had courses of sulfathiazole. The primary overtreatment reaction had been painted and smeared with the whole gamut of antiseptics, fungicides and germicides. The running together of pustules and antiseptics was a constant observation.

The upper or the lower extremity was always involved; both soles, 2 cases; right sole, 6 cases; left sole, 2 cases; the palms, 2 cases; left palm, 2 cases, and the right palm, 2 cases. At the initial observation, the affected palm or sole displayed a weeping dermatitis, in some cases so severe that dripping occurred. The hand or foot felt cool to palpation; the indolent clamminess attracted attention. The complexion was light olive color, which to a more or less degree involved the entire skin. Even in hot weather these patients complained of being cold. They described how they felt as "awful" and they are depressed and suffer from nervous exhaustion. In this series of cases, this stage prevailed only a day or so, when suddenly something let go. The temperature rose, the highest in the series being 102 F.; the leukocytes increased, the highest count being 20,500; albumin appeared in the urine in some, a trace to 2 plus; the olive color gave way to mild flushing; the weeping of the primary overtreatment reaction ceased, and showers of new pustules appeared. The affected palm or sole was now hot to palpation. Lymphangitis streaked up the flexor surface of the arm or leg with tenderness along the medial distal insertion of the biceps, in the axilla under the midportion of the pectoralis major or in the groin if the sole was involved. All the pustules soon ruptured, a yellowish-tinged serum poured forth and the systemic manifestations subsided as abruptly as they appeared. The temperature was back to normal in less than twenty-four hours. The patients were now in good spirits, as if the systemic reaction which prompted a profuse drainage had gotten rid of something that was poisoning them.

The reactions to past treatment patch tests disclosed that all these patients reacted to one or more of the organic mercurials; 6 patients also reacted to ethyl aminobenzoate and 7 to proprietaries containing phenol or cresols.

C. GENERALIZED DERMATITIS

The 29 patients having generalized dermatitis were classic examples of the toxicity of dermatologic remedies. They had converted a simple dermatitis venenata due to plants into a primary overtreatment reaction which caused seizures of generalized itching. These patients erroneously believed that the dermatitis was spreading and took measures to prevent it. Often the same remedy was applied over the entire skin that had caused the primary overtreatment reaction. It is obvious that this group accounted for the 9 patients hospitalized not because of the severity of the dermatitis but because of the severity of the symptoms. Chemicals purported to allay itching reversed themselves and caused intense itching.

Ethyl aminobenzoate elicited positive reactions in patch tests in 7 cases; one or more of the mercurials in 6 cases; grindelia in 6 cases; a proprietary containing tannic acid in 3 cases, butesin picrate in 2 cases, and dibucaine hydrochloride in 2 cases. A generalized follicular gangrene followed the application of copper sulfate in 2 cases and a solution of formaldehyde in 1 case. (This last patient stated that she read in *Reader's Digest* "that fungi can spread over the whole body," and she knew that the itching was due to the fungi biting her so she added a solution of formaldehyde to the bath which she had read would kill fungi.)

comment, "You know I'm very nervous." When they were asked whether their nervous systems had been examined or tested there followed a puzzled expression and the answer, "No." It seems incredible that these guessed at "nerve diagnoses" are on the increase just when the "too much acid" diagnoses are on the decrease. The nervous condition in these patients disappeared when the plant and therapeutic chemical contactants were removed and the skin was given a chance to resume its normal functions.

E. ADVERSE REACTIONS FROM RHUS EXTRACTS

Among the improperly treated patients were 24 who had received one to four injections of various brands of Rhus extracts for the relief of symptoms and treatment of the dermatitis. Of these, only 9 had clinical evidence of Rhus dermatitis; in 6 a weed or grass was the cause and in 9 the offender was unknown. Apparently these "shots" are given hit or miss for any or all dermatoses that itch during the summer. Instead of relieving symptoms and involuting the dermatitis, the injections intensified the symptoms and made the dermatitis worse. Eight patients complained of severe generalized itching; in 4 urticaria developed, of the giant type in 1 case. In 1 patient a universal erythrodermia developed with subsequent exfoliation. Seven patients noted a generalized patch dermatitis. Four patients showed a derma-

Fig. 3.—The cause of residual dermatitis, daubing.

D. NEUROLOGIC MANIFESTATIONS

Overlooked or not appreciated is the fact that the skin is an organ of special sense whose afferent and efferent stimuli are integrated with the body economy. Cutaneous symptoms with or without the advent of signs cause a psychic response exactly like a throbbing tooth, an aching ear, a pain in the chest or abdomen. Among the 50 patients with plant dermatitis properly cared for, there was a minimum of worry; but among the 152 improperly cared for, there were indications of psychic upsets. The spreading of dermatitis, especially near the eyes, the sudden appearance of lesions all over the body, or aggravation of the initial dermatitis struck fear and panic into these patients with resulting disruption of their normal living, sleeping, eating, pleasures and habits. The specter of overwhelming infection or some fatal disease hung over their thoughts, and when relief was not forthcoming—their family physician was baffled—they sank deeper and deeper into abject misery and nervous exhaustion. In this series 63 patients interrupted the history and asked whether their nerves were not the cause of their skin trouble. They added the

titis at previous sites of plant dermatitis and a profuse weeping at the present site. Aside from this group, there were 8 patients who had had injections of Rhus in previous seasons. One of these had received a total of forty treatments; yet no protection was afforded.

During the spring of 1946, we received leaflets describing the indications for thirteen different brands of Rhus extracts. In addition, we saw many advertisements in medical journals urging their use and extolling their specificity. A review of the leaflets brought out the range of confusion of dosage and time of administration. While such pieces of advertising are usually so up to date that unpublished investigations are referred to, the references in these leaflets were for the most part ten or more years old. Only one leaflet mentioned an unfavorable report, in spite of the fact that Krause and Weidman,¹⁷ Templeton,¹⁸ Zisserman and Birch,¹⁹

17. Krause, G. L., and Weidman, F. D.: Ivy Poisoning: Preventive Treatment with Special Reference to Individual Susceptibility, *J. A. M. A.* 84: 1996 (June 27) 1925.

19. Zisserman, L., and Birch, L.: Prophylaxis and Treatment of Poison Ivy Dermatitis with Extract of Rhus Toxicodendron, *J. Allergy* 10: 596, 1939.

Simon and Lotspeich,²⁰ Shelmire,²¹ Sompayrac²² and Howell²³ found these extracts of no or questionable value. We do not use such extracts, consider them dangerous and believe additional studies are required to prove their value and lack of toxicity. Stevens²⁴ stated that the treatment of the acute rash with ivy extracts should be discouraged because the condition of many patients is made worse and there is no satisfactory evidence that any are helped.

Fig. 4.—The clinical appearance of keratosis from decolorized tars, left forearm, extensor surface.

CHRONIC CUTANEOUS COMPLICATIONS FROM DERMATOLOGIC REMEDIES

An integral part of our dermatologic histories concerns past and present exposures of the skin to therapeutic chemicals. The number of patients who have noted the onset of dermatitis during or after a period

Fig. 5.—Histologic structure of keratosis when about three weeks old.

of hospitalization are on the increase. Tracing such exposures to antiseptics, particularly surgical and traumatic cases, may reveal the cause of the dermatitis or explain an exacerbation. Another common observation is the onset of dermatitis following trivial scratches, cuts or burns. A review of the chemicals applied may explain an acute, chronic or recurrent dermatitis. These etiologic factors are frequently overlooked and the resulting dermatitis diagnosed as something else.

A. FURUNCULOSIS

To allay concern on the part of patients with a severe primary overtreatment reaction, especially those with generalized dermatitis from therapeutic chemicals, they are told to expect crops of furuncles. There were 16 patients on whom they developed after the primary overtreatment reaction had involuted. Another 7 had them after their generalized dermatitis had subsided. The furuncles appeared suddenly, drained within twenty-four hours when poulticed and healed promptly.

Fig. 6.—The histologic structure of a keratosis about six weeks old.

We interpreted them as excretory reactions, the re-establishing of the glandular functions of the skin.

B. PIGMENTATION

Three patients had irregular, brownish black blotches of pigmentation which appeared after use of a remedy containing ferric chloride for plant dermatitis. The discolorations were located on the right leg, thigh and forearm respectively. Weiss and co-workers²⁵ reviewed the literature, recording 11 cases, and recommended that iron salts should not be used in the treatment of dermatitis venenata due to plants.

C. RESIDUAL DERMATITIS

The residual dermatitis was recognized when observed in 31 patients. It was disconcerting to view these patients with acute plant dermatitis, and then to learn that the site of their chronic dermatitis was originally the site of dermatitis venenata due to plants which following the use of dermatologic remedies "did not get well as it should." There were 20 women and 11 men, all of whom were in the fourth to sixth decades of life. The duration varied from one to seven years. The location was the lower third of the right leg, 14 cases; both legs, lower third, 8 cases; both hands, 2 cases; left forearm, 2 cases; neck, 2 cases; ears, 1 case, and the lower third of the left leg, 2 cases.

The past-treatment patch tests elicited positive reactions to one or more of the mercurials in 24 cases, proprietaries containing decolorized tars 8 cases, methyl salicylate 8 cases, pine tar 6 cases, juniper tar 5 cases and resorcinol 3 cases.

REPORT OF A TYPICAL CASE.—A. B., a white man aged 43, a mine electrician, purchased a home in the country where the family budget could be supplemented by garden and dairy produce. During the late summer he acquired a dermatitis of the feet and legs. To him the itching and little water blisters warned of a fungous infection. There were many remedies at the corner drug store, so the fungus killing was started. After four or five of these had been tried with the dermatitis getting steadily worse, physicians were visited one after another. Over a period of one year, fifteen were consulted, of whom four were dermatologists. Roentgen therapy had been used to tolerance. Coinciding with the time of the first appearance of the dermatitis, another attack

Fig. 7.—The advertiser's appeal for treatment of symptoms.

occurred. This time the thighs, hands and forearms also were involved. Patch tests with suspected plants showed dogfennel, growing plentifully over the property, to be a strong sensitizer. This patient on moving to the country acquired a dermatitis venenata which he wrongly diagnosed and thus wrongly treated. From remedies he altered the signs and converted acute dermatitis into chronic. He brought in for past treatment patch testing, sixty-two different remedies, some of which are shown in figure 3, which portrays the treatment received, namely "daub-

ing." The latter cost this patient over \$3,000. Patch tests elicited positive reactions to twelve remedies and the mercurials.

D. KERATOSES

Keratosis were not recognized until the third case had been noted. They were observed on the forearms in 4 cases and on the lower third of the legs in 2 cases. Each patient had applied a decolorized tar several weeks to a month or more to an acute overtreatment reaction. As the latter subsided, tumors measuring 4 to 6 mm. in diameter were observed at the probable sites of

old pustules. Early in the development they were soft to palpation but on aging became firm. The entire surface showed a fine scaling. After tar therapy was stopped, they disappeared slowly, requiring one to two months. The clinical appearance of the keratoses is shown in figure 4. The lesions were about three weeks old and their histology is shown in figure 5. The change that takes place with aging is shown in figure 6. This section was obtained from another case; the lesions were about six weeks old.

E. DERMATITIS PEDIS

The fashion of wearing footwear designed like sandals with the feet stockingless accounts for the 38 patients who had a concurrent attack of dermatitis venenata on their feet. To most people anything below the ankle that itches is a fungous infection. School children tell us about the fungi biting their toes. Only 7 patients had properly treated their dermatitis, and the

not satisfactory, he relies on the advice of relatives or friends who make snappy diagnoses and advocate absurd treatments. Persons who mistreat their skin are blameless. They are victims of false and misleading information as were persons several decades ago who swallowed various potions to cure their miseries. Knowledge about the care of the skin is so backward that it countenances attempts to tan the skin in the living state with chemicals disguised as remedies.

B. THE TREATMENT OF SYMPTOMS

If one can read or hear these days, to get relief from cutaneous symptoms is as simple as buying a remedy. The eye catchers in figure 7, were clipped from advertisements in "free" medical periodicals, certain state medical journals whose advertising must compete with the former and the monthly avalanche of professional mailing pieces; only a few were from newspapers and magazines. It is clear that the indications for applying

Fig. 8.—Dermatologic remedies for symptomatic dosing of dermatitis venenata due to plants.

remaining 31 were the victims of false information. In their zeal to kill fungi and to prevent secondary infection, they had unwittingly poisoned the skin of their feet. The past treatment patch tests elicited positive reactions to one or more mercurials in 28 cases, proprietaries containing salicylic acid in 8 cases, ethyl aminobenzoate in 7 cases, phenol and cresols in 8 cases, hydroxyquinoline sulfate in 6 cases, absinthin, menthol, echinacea or calendula in 4 cases and solution of formaldehyde in 2 cases. Mapother²⁶ observed 100 patients with diseases of the skin on hospital trains from the South Pacific. Half came on hospital ships with physicians and nurses in attendance who were well supplied with sulfonamide drugs, benzoic and salicylic acid ointment and ammoniated mercury ointments. These patients were walking when they boarded ship but were stretcher patients when they arrived. The other half came on freighters with no medical attention and were nearly all well on arrival.

THE CAUSE OF OVERTREATMENT DERMATITIS

A. THE LACK OF KNOWLEDGE OF HOW TO CARE FOR THE SKIN

A person seized by abdominal pain thinks first of calling a physician. He would not take a purge, and if a friend or relative would suggest a pain pill, he would consider his intelligence insulted. This same person, however, can have a seizure of cutaneous symptoms or have signs develop of a dermatitis, and he will look for relief and treatment in the family medicine chest or the corner drug store. In his judgment if progress is

remedies for the skin are not the treatment of the disease but the hope of getting rid of symptoms. Forget about the diagnosis but take steps to "ditch that itch." Some remedies, wonderful for itching, were approved by *Good Housekeeping*. If physicians received a similar barrage of extravagant advertising, trailed by the host of chemicals in table 3, for the relief of pain, they would exclaim, "We are back in the days of Lydia Pinkham!" To prove that cutaneously she still suffers with us²⁷ and that her spirit cares for the summer scourges by symptomatic dosing, figure 8 was taken.

C. THE TREATMENT OF SIGNS

A classification was made, table 4, of the declared pharmacologic actions and indications of the remedies in table 3. Observe how persons are encouraged to treat symptoms, signs and the traumas, whether physical or mechanical. Irritations of the skin called for sixty-two different remedies containing a wide selection of chemicals and a remarkable variability in their concentration. Burns of the skin could be treated with seventy-three different remedies. A long list of diseases were mentioned which presupposes that the public is skilled in dermatologic diagnosis. There were two remedies for pemphigus, three for dermatitis herpetiformis, three for erysipelas, and to add a ridiculous touch, eleven were indicated for the skin disease, "etc."

D. CONFUSION OF PHARMACOLOGICAL ACTIONS

The overtreated patients pointed out in their collections of remedies prescription after prescription that instead of helping them made their dermatitis worse. This comment was frequently heard, "Our family doctor is a good doctor but this salve he

Gave me to use burnt me up." The collection seldom contained one prescription, but commonly two or three and sometimes four to six. The number of physicians who, through no fault of their own, lost their patients far exceeded the number of overtreated patients. An explanation is apparent in table 4. Dermatitis venenata due to plants is not an infection; yet 43 preparations were antiseptic, 5 bacteriostatic and 5 germicidal. Fungi were killed by 5 remedies, but there were 41 other mixtures declared to be just as effective for athlete's foot. Itching was relieved by 48 different proprietary. The number of chemicals achieving such specificity would be news to dermatologists. It should be mentioned that nine preparations pharmacologically were pleasant, 11 prompt, 11 deodorants, 10 would check spread and 46 were healing.

E. THE WRONG DIAGNOSIS

Commonly the signs of an initial dermatitis venenata due to plants are changed by some home treatment.²⁸ This was not recognized and the most common error was to call the primary overtreatment reaction a fungous infection or a secondary infection. Therapies directed at such diagnosis produced the greatest incidence of overtreatment. We believe that the research and clinical laboratory have furnished data insufficiently critical of true and false pathogenicity of bacteria and fungi, with the result that physicians have been misled and have innocently produced overtreated dermatitis.

THE NEED FOR A COUNCIL ON DERMATOLOGIC HYGIENE AND THERAPEUTICS

Persons in all walks of life seem to regard the skin and its appendages—the hide concept—as an inert covering, something as tough as leather and deserving the same care: namely, soaping, greasing, oiling, painting, dyeing, polishing and of late conditioning. We believe that the science of skin hygiene has

looking up the treatment of Rhus dermatitis in certain textbooks would be greeted with various steps to be taken, each of which needed different chemicals. If he delayed therapy until the procedures were mastered, the patient would probably be well; but if he picked out some formula to try, as likely as not over-treatment would result, especially if the formula for the last stage was used for the first stage. The result of this befuddlement

rested too long in the hands of those with something to sell. The promoters of the enterprises that trade on the human skin talk knowingly and cite eminent authorities, but their propaganda commonly causes skin trouble, like the fourteen day dermatitis of thirty-six skin specialists. Dermatitis from external causes is the most common dermatosis seen by us, and its incidence continues to rise. Reports that this or that contactant causes dermatitis continue to flood the literature. The offender is always apprehended after instead of before it has caused trouble. A mass of data has been published which needs to be integrated and used as the basis for establishing a modern concept of dermatologic hygiene. For example, we have asked several hundred patients their definition of a clean skin. Invariably, it was a skin that had been soaped and rinsed with water. We question this definition and incline more to the belief that a skin is clean when water-soluble substances have been rinsed off with warm water. The portion of the lipid film insoluble in water that remains protects the horny mantle. Exposing the latter predisposes to dermatitis. A person who does not care for his skin properly is the victim of misleading information, but the responsibility for his dermatitis rests on the shoulders of those to whom he has entrusted his health. That care of the skin which prevents dermatitis will be the science of dermatologic hygiene.

Over one hundred different chemicals make up the formulas of the proprietaries, table 3, whose many therapeutic indications of which included dermatitis venenata due to plants. A review of textbooks on dermatology and allergy showed the same treatment versatility of topical chemicals; the number and composition of the formularies seemed endless. Some mixtures required fastidious compounding in order to be effective. A physician

of chemistry, pharmacology, dosage and indications of dermatologic chemicals is shown in table 5. Improper treatment caused unnecessary suffering not only physically but also mentally and

economically. The creation of the Council on Pharmacy and Chemistry brought order out of existing chaos in oral and parenteral therapy. Exposing the symptomatic cure-alls nurtured the science of nutrition. A council on Dermatologic Hygiene and Therapeutics can end the bewilderment in diagnosis and treatment for the skin. Exposing the cutaneous symptomatic cure-alls should nurture the science of dermatologic hygiene. Making the American home safe for the skin and the prevention of dermatitis are a responsibility of dermatologists.

Clinical Notes, Suggestions and New Instruments

PREVENTION AND TREATMENT OF BEDSORES

An Air Mattress Accomplishing Alternation of Pressure Points

W. JAMES GARDNER, M.D.
Cleveland

The most important single factor in the prevention or treatment of bedsores is frequent movement of the patient, so that pressure at any one point is not permitted to exist too long. Munro¹ stated that the essentials of treatment in cases of spinal cord injury are (1) to move the patient on an hourly time schedule, (2) to prevent the development of any serious exhaustion by such methods as appropriate feeding, transfusions and administration of vitamins, (3) to prevent the occurrence of sepsis and to maintain a constantly dry bed by proper use of a tidal drainage apparatus and (4) to avoid all forms of external artificial splinting or support to the spinal column so long as the patient with the spinal cord injury is bedridden.

In certain types of cases, the frequent changes in the patient's position which are necessary to maintain the skin in a healthy state impose a serious drain on the time of the nursing staff. Since the benefit which is obtained by movement of the patient is due to a redistribution of the pressure points, an effort was made to develop a mattress which would automatically accomplish this result.

The apparatus consists of a pneumatic mattress with air cells $1\frac{1}{4}$ inches (3 cm.) in diameter, running transversely the width of the mattress. The alternate air cells are connected to a manifold which constitutes the edge of each side of the mattress. These two systems of transverse air cells are then alternately inflated and deflated at intervals of two to three minutes, so that the patient's body is alternately resting on the odd-numbered cells and then on the even-numbered cells. This produces a massaging effect which aids the cutaneous circulation. The alternate inflation and deflation of the two systems is accomplished by means of a tiny air pump which is driven by a small electric motor which develops $\frac{1}{50}$ horsepower, which runs quietly, and is connected to a system of valves which automatically shift the air first into one system and then into the other. By changing the speed of the cycle and the amount of pressure, it has been found that the most generally accepted rate is a five minute cycle at a pressure of 1 pound or approximately 70 mm. of mercury.

The alternating pressure mattress is constructed of a flexible water-proof plastic material. It is placed on top of an ordinary mattress and then the bed made up as usual except that since it is water proof it does not need to be protected by a rubber sheet. The sensation of movement caused by the operation of the mattress is usually reported as mildly pleasurable. It does not produce friction of the skin but merely a gentle compression and release. There is no movement of the patient's body or extremities because of the wide dispersion of the pressure points and the gradual inflation and deflation, which is arranged so that at the midpoint of each half-cycle the air pressure in the two systems is the same.

This type of mattress has been in use at the Cleveland Clinic since July 1947. Sixteen patients who were considered likely candidates for bedsores have been treated on the mattress for periods of time varying from five to sixty-three days. The patients selected had paraplegia or quadriplegia, due to cord compression or advancing cachexia, or were immobilized in the dorsal decubitus for long periods for treatment of a fracture of

the hip. The skin of each of these patients remained healthy, and less nursing care was required than is usually employed in similar cases.

Thirteen patients with bedsores were placed on the mattress for varying periods of time. They were turned infrequently in order to test the efficiency of the mattress. The only local therapy employed in 9 cases was mechanical cleansing of the ulcer once or twice a day followed by the application of tincture of benzoin and a sterile dressing. In 4 cases powdered sulfathiazole was substituted for the tincture of benzoin.

Nine of these patients who were in reasonably good nutritional state all showed improvement or complete healing of their bedsores after periods of from five to forty-five days on the mattress. One patient with severe ulcerative colitis and peritonitis died after fourteen days on the mattress. The sacral decubitus ulcer was unchanged. Another patient with metastatic carcinoma of the spine and a sacral decubitus ulcer died after fourteen days on the mattress with some improvement in the appearance of the lesion. Another patient with carcinoma of the descending colon died after five days, and his sacral ulcer was unchanged. A patient with paraplegia due to metastatic carcinoma of the spine with bedsores on the sacrum and left trochanter was on the mattress for twenty days without change in the condition of the ulcer. He died three weeks after discharge from the hospital.

Alternating pressure mattress. The tubes leading from the two systems of transverse air cells are connected to the air supply. The air is diverted first into one system and then into the other by a pump and an automatic valve mechanism. The mechanism is contained in the rubber-mounted cabinet attached to the foot of the bed.

SUMMARY AND CONCLUSION

The principle of the alternating pressure mattress appears to be beneficial in the prevention and treatment of bedsores in some bedridden patients. It adds to the comfort of the patient and decreases the frequency at which the position must be changed. It thereby decreases the amount of nursing care required. It does not obviate the need of measures for maintaining a dry bed, supporting the patient's nutrition and preventing sepsis.

Malarial Diabetes.—It has long been known that malaria produces different clinical syndromes according to its incidence in different organs—e. g., cerebral malaria, malarial dysentery, etc. Manson-Bahr (1946) mentions acute hemorrhagic pancreatitis caused by a blockage of capillaries by *Plasmodium falciparum*. Cerebral malaria is sometimes wrongly diagnosed as heat-stroke, sun-stroke, heat-exhaustion, and often ends in fatal coma, and the true diagnosis is established by the discovery of malarial parasites in the blood capillaries. On the other hand, latent malarial infection without clinical symptoms of sufficient gravity to attract attention is often missed. In the following case the latent malaria seemed at first to be of no clinical significance. . . . [However] the diabetes was evidently caused by M. T. malaria of the islets of Langerhans, and was apparently cured by specific antimalarial treatment.—Rau, Leo, M.D., Malarial Diabetes, *The Lancet*, July 3, 1948.

From the Cleveland Clinic and the Frank E. Bunts Educational Institute.

Council on Pharmacy and Chemistry

STREPTOMYCIN IN THE TREATMENT OF
TUBERCULOSIS

Current Status

REPORT TO THE COUNCIL

The use of streptomycin for the treatment of tuberculosis has aroused much interest which has resulted in extensive research. The following report has been adopted by the Council for publication, and it is offered to keep the medical profession informed of the progress that is being made and to minimize some of the confusion that is arising concerning this treatment of tuberculosis. In adopting this report, the Council expresses its appreciation of the cooperation that has been provided by the various groups submitting these statements and hopes that such collaboration will serve as a pattern for future research of such fundamental importance.

AUSTIN SMITH, M.D., Secretary.

The present report is a sequel to that which was published approximately one year ago¹ under the same auspices. The most important progress which it will recite can be contained in the following four statements: (1) The series of patients whose treatment has been completed has so considerably enlarged (from 500 to 2,800), and their post-treatment course has been observed for such considerable periods of time, that it becomes possible to substitute definite for presumptive statements in many instances. (2) A reduction in daily dosage from 2.0 Gm. to 1.0 Gm., and a further reduction to 0.5 Gm., has been accompanied with a significant and gratifying reduction in toxic manifestations. (3) Certainly in the case of the reduction to 1.0 Gm., and apparently in the further reduction to 0.5 Gm., there has been no loss of therapeutic efficacy, nor is any such loss encountered if the daily dose is divided into two, rather than into five, injections. (4) More prolonged observation of tuberculosis of bone and joint, and of the genitourinary tract, has made it possible to take a more optimistic view of the treatment of these diseases than was the case a year ago. A fifth statement, to the effect that much remains to be done and to be learned, on both the laboratory and clinical sides of the field, is always in order and is hereby added.

The present study was organized as a cooperative venture by the Veterans Administration, Army and Navy, in May 1946. The nine hospitals which originally participated were increased to twenty-three in December 1946 and, as of March 1948, to forty-eight, for, although no brief is made in behalf of quantity *per se*, nothing is gained by denying its particular usefulness in the case of a disease as protean in its manifestations and as unpredictable in its outcome as is tuberculosis. With the few unavoidable exceptions which will be enumerated subsequently, all cases admitted to the study were proved to be of tuberculous origin by bacteriologic or pathologic means. In all instances as a matter of theory, and in the vast majority of instances as a matter of practice, the disease of all cases admitted to the study was progressing unfavorably or was stationary at the time streptomycin therapy was

started. Five regimens have been studied in sufficiently large groups of cases to permit rather precise evaluation of their comparative effectiveness. Three additional variants are being presently explored. The selection of new regimens for exploration has been made by the investigators and a group of consultants, in conference assembled, after a review of their previous experience. When more than one selection was made, the participating hospitals voluntarily assigned themselves to the one or the other. The conferences which made and effected these decisions have been held semi-annually. The previous report to the Council¹ was made on the basis of data submitted to the Third Conference in St. Louis in May 1947. The present report is based on data submitted to the Fifth Conference in Chicago, during April 1948.

The Fifth Conference received acceptable data² on 2,780 patients for whom treatment with streptomycin had been completed between June 1946 and March 1948. These patients are listed in table 1, according

to the categories of disease in which they fall. The results will be discussed in the order in which the categories appear within the table.

RESULTS OF INVESTIGATION

PULMONARY TUBERCULOSIS

The results of treatment with the initial regimen (1.8 to 2.0 Gm., in six or five divided doses, daily for one hundred and twenty days) were described in the previous report and have subsequently been published.³

2. The majority of these data were contributed by the following twenty-three hospitals. Fitzsimons General Hospital (USA), Denver; Corona Naval Hospital (USN), Corona, Calif., and Veterans Administration Hospitals at Brecksville, Ohio; Bronx, N. Y.; Butler, Pa.; Castle Point, N. Y.; Dayton, Ohio; Excelsior Springs, Mo.; Hines, Ill.; Legion, Texas; Livermore, Calif.; Memphis (Kennedy), Tenn.; Minneapolis; Oteen, N. C.; Richmond, Va.; Rutland Heights, Mass.; San Fernando, Calif.; Staten Island, N. Y.; Sunmount, N. Y.; Van Nuys, Calif.; Walla Walla, Wash.; Waukesha, Wis., and Wood, Wis. Data on a smaller number of cases were contributed by Veterans Administration Hospitals at Albuquerque, N. M.; Alexandria, La.; Bedford, Mass.; Chamblee, Ga.; Cleveland, Columbia, S. C.; Dearborn, Mich.; Fort Howard, Md.; Fort Logan, Colo.; Framingham, Mass.; Los Angeles; Louisville, Ky.; Martinsburg, W. Va.; McKinney, Texas; Nashville, Tenn.; Newtonington, Conn.; New Orleans; Oakland, Calif.; Outwood, Ky.; Springfield, Mo.; Temple, Texas; Wadsworth, Kan., and Whipple, Ark., and by Nepemung Sanatorium, Nepemung, Minn., and Glen Lake Sanatorium, Oak Terrace, Minn.

3. The Effect of Streptomycin upon Pulmonary Tuberculosis, Streptomycin Committee, Veterans Administration, Am. Rev. Tuberc. LVI: 485-605 (Dec.) 1947.

Because of lack of space this article has been abbreviated in THE JOURNAL. The complete paper will be found in the reprints.

Prepared by the Streptomycin Committee, Veterans Administration, at the request of the forty-eight Veterans Administration, Army and Navy Hospitals that are cooperating in the study.

1. The Effects of Streptomycin on Tuberculosis in Man, report to the Council on Pharmacy and Chemistry, J.A.M.A. 135: 634-641 (Nov. 8) 1947

The intervening year has been devoted to examining the effect of changing this regimen, on the one hand by decreasing the duration of treatment and, on the other hand, by decreases in the daily dosage. Four variations on the original theme have been used: 2.0 Gm. in five doses for sixty days, 1.0 Gm. in five doses

Fig. 1.—Comparison of characteristics of groups of cases of pulmonary tuberculosis treated with different regimens of streptomycin (forty-eight Veterans Administration, Army and Navy hospitals, April 1948). The vertical column of figures at the left shows the percentage of cases.

for one hundred and twenty days, 1.0 Gm. in two doses for one hundred and twenty days, and 0.5 Gm. in two doses for one hundred and twenty days. The results of the five regimens, as recorded by the investigators in 943 patients,⁴ appear in table 2, those of the two 1.0 Gm. groups being pooled, since it developed that there was no clear difference between them. The duration of post-treatment observation varies, of course, with the length of time the regimens have been under study. In the two oldest regimens (columns 1 and 3 of table 2) it exceeds three months in 80 per cent of the patients and, in one of these (column 1), exceeds twelve months in 14 per cent.

Figure 1 indicates the similarity in the extent and character of the disease treated by the several regimens and figure 2 illustrates certain results which occurred during and after therapy. In the latter figure the roentgenologic results are recorded as of one hundred and twenty days after beginning streptomycin in all three regimens, and the 0.5 Gm. regimen has been excluded because the brevity of post-treatment observation distorts certain of its data.

Roentgenologic Results.—Table 2 reveals a rather striking similarity both in the status of the disease prior to treatment and in its course during the administration of streptomycin by all of the regimens. An improvement, which had been present in only 1 to 5 per cent of the patients prior to treatment, appeared in from 77 to 83 per cent during treatment.

Roentgenologic observations being a rather subjective matter, it was considered wise to expose this decision to an unprejudiced jury. For that reason, ten phthisiologists,⁵ not connected with the study except by ties of common interest, were nominated by the president of the American Trudeau Society and spent three days of March 1948 in reviewing the roentgenograms of about 300 patients with tuberculosis who had been treated by three regimens of streptomycin in groups of approximately 100 each. Four roentgenograms from each patient were viewed and graded, altogether independently by each of four jurors. Examination of the

pretreatment roentgenograms was completed before the roentgenograms taken during treatment were seen. A preliminary analysis of the data, from this rather severe test, indicates complete qualitative agreement between jury and investigators as to the similarity of the roentgen changes which occurred during the several regimens. Quantitatively, the jury adjudged the changes to be less, but not decidedly so; they thought that 9 to 13 per cent (as compared with 1 to 5 per cent) had been improving prior to therapy and that 71 to 75 per cent (as compared with 77 to 83 per cent) had improved during therapy, a difference at least partially due to the fact that the jury weighed the changes in each lung separately whereas the investigators considered only the lesions against which treatment was being directed. Figure 3 presents the result of their evaluation graphically and grades the degrees of improvement or worsening during the pretreatment and treatment periods in "1" to "4," representing, respectively, variations from "slight" (plus or minus 1) to "very marked" (plus or minus 4). The similarity of the curves with their peaks to the left indicates the similarity in the pretreatment course of the lesions selected for treatment by the three regimens, while the similarity of the curves with their peaks to the right indicates their similarity to the response to treatment by these regimens; the disparity between the two groups of curves (with their respective peaks near minus 2 and plus 2) indicates the difference between pretreatment and treatment courses. In the series treated for only sixty days, improvement continued to occur during the sixty days following its completion; the opinions recorded in figure 3 are based on roentgenograms taken one hundred and twenty days after the commencement of therapy. One of the points which this figure does not demonstrate, but which has been derived from the data is that 75 per cent of the patients who were

Fig. 2.—Results of treatment of pulmonary tuberculosis with different regimens of streptomycin (forty-eight Veterans Administration, Army and Navy hospitals, April 1948). The vertical column of figures at the left shows the percentage of cases. The unlined columns represent the regimen of 2 Gm. for one hundred and twenty days (375 cases); the notched columns represent the regimen of 1 Gm. for one hundred and twenty days (398 cases), and all checked columns represent 2 Gm. for sixty days (114 cases).

becoming worse prior to streptomycin therapy (as opposed to those whose roentgenograms showed no change or improvement) improved during treatment, a reversal in trend which is regarded as especially significant. It will be observed that the jury review did

4. The results in 184 additional cases, from a single hospital, have been omitted because of differences in the method of study and reporting.
5. Dr. Howard M. Bosworth, Dr. William G. Childress, Dr. David A. Cooper, Dr. Bruce H. Douglas, Dr. H. Harold Fellows, Dr. John N. Hayes, Dr. Kirby S. Howlett Jr., Dr. Herbert L. Mantz, Dr. John H. Skawlem and Dr. Julius L. Wilson.

not extend to the 0.5 Gm. per day regimen, and on this account, as well as because of the relatively small size of the series, the results in this regimen are regarded as requiring additional confirmation, although they were analogous to the others in the judgment of the investigators.

Let the recital of these figures give an impression of unbridled enthusiasm, three points should be made clear: (1) The type of lesion under discussion is carefully selected, relatively recent and predominantly exudative; the unsuitability of many patients with pulmonary tuberculosis for streptomycin therapy is evidenced by the observation that, although 9 of 10 cases of tuberculosis in Veterans Administration hospitals are of this type, in only one third (943 of 2,780) of the cases covered by this report was treatment given for the pulmonary disease. (2) The type of clearing which has been recorded as "improvement" is partial and only rarely complete. (3) The percentage of relapses which occur after improvement during treatment (7 to 10 per cent), and following treatment (14 to 29 per cent), is considerable (fig. 2).

Clinical Changes.—Clinical improvement, when it occurs, is prompt and obvious within the first two weeks of treatment. In its timing, as would be anticipated, it precedes roentgenologic improvement which may be obvious on the thirty day roentgenogram but is rarely considerable before the roentgenogram taken sixty days after the beginning of treatment. A decrease in cough and an increase in sense of well-being occur with such constancy that their incidence was not recorded. Fever was reduced to normal in approximately 60 per cent (table 2) of those patients who were febrile at the time treatment was started, and approximately 45 per cent of the patients gained more than 10 pounds (4.5 Kg.) in weight. Conversion of the reaction of the sputum to negative, as demonstrated by the relatively rigid criteria of three successive negative monthly cultures, was reported in from 21 to 32 per cent of patients on the various regimens (fig. 2). Fifty-two (5.9 per cent) of the 887 patients treated under the three regimens initiated more than a year ago are now dead.

Consensus.—It was agreed that the previous decisions as to the role of streptomycin in the treatment of pulmonary tuberculosis had been confirmed and had been amplified by the study of additional regimens. Thus, sixty days of treatment had proved as effective as one hundred and twenty days, 1.0 Gm. per day as effective as 2.0 Gm. per day and 0.5 Gm. per day, probably, as effective as either. Streptomycin, in conjunction with bed rest, has been demonstrated to reverse the trend of progressive predominantly exudative moderately and far advanced disease in a formidable majority of the cases. Since this reversal does not usually extend to complete clearing and since a considerable percentage of relapses occur, streptomycin therapy is rarely definitive. Its most frequent usefulness appears, therefore, to lie in conjunction with collapse therapy. In the opinion of the investigators, collapse therapy was made feasible by streptomycin therapy in approximately 20 per cent of the patients and was actually induced in approximately 25 per cent following the conclusion of treatment. It was agreed that the optimum time to induce collapse was during the first weeks of streptomycin therapy before the microorganisms become resistant (referred to subsequently). This combination of procedures has been followed since October

1947; there seems to be little doubt about its logic, but its effectiveness will be difficult to evaluate.

It was further agreed that it was unwise to use streptomycin in the treatment of minimal pulmonary tuberculosis until some means of avoiding the development of resistance had been found; this, on the generally accepted thesis that one's single bullet should not be used against a skunk when a tiger is in the offing.

It was, finally, agreed that streptomycin did not, and could not be expected to, affect favorably the roentgenologic picture in long-established fibrous or caseous lesions and that its effect on cavities was unpredictable and often, when favorable, fleeting.

TRACHEOBRONCHIAL AND LARYNGEAL TUBERCULOSIS

The results of streptomycin therapy in 112 cases of tracheobronchial and 166 cases of laryngeal tuberculosis are shown in table 3. The demonstration of acid-fast bacilli in sputum by culture was accepted as evidence of tuberculous causation in the presence of repeatedly positive bronchoscopic or laryngoscopic observations. Administration of streptomycin by aerosol was abandoned rather early in the course of the

Fig. 3.—Radiologic changes during successive sixty day and one hundred and twenty day periods before and during streptomycin therapy (jury review of 286 patients with pulmonary tuberculosis in thirteen Veterans Administration hospitals, March 1948). The unbroken line represents the regimen of 2 Gm. for one hundred and twenty days (three hundred and thirty-two opinions regarding 83 patients); the broken line represents the regimen of 2 Gm. for sixty days (four hundred and four opinions regarding 101 patients), and the dotted line represents the regimen of 1 Gm. for one hundred and twenty days (four hundred and eight opinions regarding 102 patients). The legends "worse" and "better" indicate changes during the period of treatment. The vertical column of figures at the left shows the percentage of jurors' opinions.

investigation when it was proved to be a relatively ineffective route of administration, and all streptomycin was injected intramuscularly. In the 1.0 Gm. per day and 0.5 Gm. per day regimens, the drug was given in two injections at twelve hour intervals. The duration of treatment was one hundred and twenty days, or until shortly after maximum improvement was observed.

It will be noted (table 3) that, when complete healing occurred, it required an average period of eight weeks, but that entire relief of pain and dysphagia occurred with more promptness and greater constancy. Although in both tracheobronchial and laryngeal tuberculosis, between 80 and 90 per cent of the lesions are reported as either healed or as moderately or decidedly improved, on direct observation the results are less constant than those of the small series which were first reported from this study.⁶ This difference would

6. Brewer, L. A., III, and Bogen, E.; Streptomycin in Tuberculous Tracheobronchitis, *Am. Rev. Tuberc.* LVI: 408-414 (Nov.) 1947.

not appear to be due to the inclusion of "noninflammatory fibrostenotic" lesions in the present series, for less than 10 per cent of the cases are reported to have been of this character. It may have been the tendency to include inflammatory lesions, as distinct from the purely ulcerative lesions which characterized the first series. It will be observed that the results with 1.0 Gm. per day appear superior to those obtained with 1.8 or 2.0 Gm. per day. It seems unlikely that this was the case. The difference may be ascribed to increasing skill in the selection of appropriate cases as the investigation progressed or to differences in the pretreatment duration of the lesion, which was reported as averaging only five months in the patient receiving 1.0 Gm. per day and as nine months in those receiving the larger dose. Over one half of the cases have been observed between three and twelve months after the completion of treatment, and, during this period, the lesion has been observed to recur in from 8 to 13 per cent of the cases; patients who have been retreated have responded well. This may be as good a place as any to remark that relapses have occurred following streptomycin therapy in all types of tuberculosis which have been observed in any quantity during this study.

Consensus.—Although the results were slightly less successful than those in the small series reported last year, it was agreed that improvement in from 80 to 90 per cent of the cases justified the original conclusion that tracheobronchial and laryngeal tuberculosis compose one of the most favorable fields for streptomycin therapy. One gram per day proved certainly as successful as the larger dose, and, judging from a too small series of cases, 0.5 Gm. per day would appear to be equally so. Although the underlying pulmonary pathologic condition is, in these cases, frequently of a type which streptomycin cannot be expected to affect, and although relapses may be anticipated in consequence, it was felt that the prompt and enormous improvement in the distressing symptoms of laryngitis was alone worth the price—so to speak—of the entire study.

CUTANEOUS SINUSES AND FISTULAS

Table 4 presents the results which have followed the use of streptomycin in 368 patients with six hundred and seventy-four cutaneous sinuses and fistulas. A tuberculous cause was established in each patient by biopsy of a tract or by culture of the drainage material. The average duration prior to treatment was forty-five weeks. All streptomycin was injected intramuscularly for a period of one hundred and twenty days, and a new regimen, employing only 0.2 Gm. per day, was explored in an attempt to establish a minimal effective dose.

The results were, again, less striking than those obtained in the original series,⁷ in which, it may be remembered, fifty-nine of sixty sinuses (98 per cent) healed completely. In the present, much larger, series, approximately four of five sinuses and fistulas (78 per cent) have healed. Healing occurred, on the average, in eight weeks. An attempt was made to trace this discrepancy in results by distinguishing first between sinuses and fistulas and then by dividing these into subgroups on the basis of their origin. The attempt was successful in the sense that 86 per cent of the sinuses, and only 57 per cent of the fistulas, healed. Sinuses originating in bone healed more frequently

than those with other origins, and fistulas connecting with the pleura did least well. It is the predominance of fistulas in the group treated with 1.0 Gm. per day that makes the results with this dosage (table 4) appear inferior to those obtained with the larger dosage; the appearance is deceptive. The series treated with 0.5 and 0.2 Gm. per day are too small to warrant comment, but it is a fact that six of seven sinuses treated with the smaller dose have healed, although, the investigators thought, more slowly than would have been the case with larger doses.

The practice of combining surgical procedures with streptomycin therapy has proved its value and is being generally followed by all investigators. Pus is evacuated and necrotic tissue or bone removed either at the time streptomycin therapy is started or shortly thereafter. This was accomplished in one third of the patients in the present series. Seventy-six per cent of the patients receiving the two larger dosage regimens have been followed up for between three and twelve months since the completion of therapy, with a relapse rate of only 2 per cent.

Consensus.—The striking usefulness of streptomycin in the treatment of cutaneous sinuses and fistulas has been confirmed beyond doubt. A regimen employing 1.0 Gm. per day is as effective as larger doses, and there is suggestive evidence (table 4) that smaller doses may be equally useful. Incision and drainage may be safely performed.

MILIARY AND MENINGEAL TUBERCULOSIS

In terms of end results, the situation has deteriorated somewhat since the earlier report,¹ although not beyond anticipation. Of the first 100 patients with bacteriologically proved diagnosis, treated between March 1946 and May 1947,⁸ 49 were alive at the latter date, 40 in October 1947 and only 24 in April 1948. Of these 24 survivors, 12 are among the 22 with initial diagnosis of acute miliary tuberculosis, 9 are among the 43 with tuberculous meningitis and only 3 are in the group of 35 with combined miliary and meningeal disease which has, by all odds, the worst prognosis. Fifteen of the 24 survivors were substantially normal in April 1948, between eleven and twenty-five months after treatment was instituted. The late deaths have usually (14 of 16) been due to the development of meningitis in the patients who previously had acute miliary tuberculosis and to relapses in those with meningitis. The only changes in protocol which have been made by the Conferences since May 1947 have introduced combined streptomycin-"promin" (sodium p,p'-diaminodiphenylsulfone-N,N' didextrose sulfonate) therapy—the latter drug being injected intravenously in a daily dosage of 4.0 Gm. during two of every three weeks—a reduction of the intrathecal dose of streptomycin to 0.05 Gm. three times a week and, in the presence of combined disease, an increase in the intramuscular dose to 4.0 Gm. daily for fourteen days and then a reduction to 3.0 Gm. for the remainder of the course. Under this revised protocol, 160 additional patients have been treated, but the data regarding them had not been collected for the Fifth Conference. The changes would not appear to have improved the results.

Consensus.—It was agreed that the immediate clinical response and the resolution of pulmonary lesions made the continued use of streptomycin mandatory in

7. Brock, B. L.: Streptomycin in the Treatment of Draining Tuberculous Sinuses, *J. A. M. A.* 135: 147-149 (Sept. 20) 1947.

8. Bunn, P. A.: One Hundred Cases of Miliary and Meningeal Tuberculosis Treated with Streptomycin, *Am. J. M. Sc.*, to be published.

all cases of tuberculous meningitis and acute miliary tuberculosis. The end results, in terms of surviving patients, are still remarkable in comparison with pre-streptomycin days, although less happy than had been hoped. The careful pathologic studies which are now in progress should add considerably to existing knowledge of the pathologic changes and pathogenesis of both pulmonary and meningeal lesions. It was also agreed that little or nothing had been learned about the most effective regimen, as to duration, dosage or route of administration. There was a general feeling that something new would have to be added, but, as to what that something should be, there was a paucity of ideas.

TUBERCULOSIS OF BONES AND JOINTS

In bone and joint disease the situation has changed rather radically for the better since the previous report.¹ At that time (May 1947) 26 patients were under treatment. At this time (April 1948), 192 patients have completed treatment. In all cases except those involving the spine, where diagnosis by repeated roentgen observation was acceptable under the protocol, the tuberculous causation was proved by bacteriologic or pathologic means. All patients except 2 received streptomycin for one hundred and twenty days in the amount of 1.0 Gm. (67 patients) or 2.0 Gm. (123 patients) daily, the results of the two regimens, according to the investigators, being indistinguishable. There are no data yet available on the results of treatment with 0.5 Gm. per day.

The investigators were asked to report to the Conference on the changes in the local signs (i. e., inflammation, pain, swelling, limitation of motion) and in the roentgenograms which occurred during treatment. They found the local signs to have shown some degree of improvement in 91 per cent of the patients and to have either disappeared or shown decided improvement in 53 per cent. The roentgenologic results were less favorable, only 34 per cent showing improvement and 59 per cent being unchanged. They also reported roentgenologic improvement to have occurred in 23 per cent of patients during the post-treatment observa-

Fig. 4.—Radiologic changes in tuberculosis of bones and joints during successive periods before, during and after streptomycin therapy (94 patients; jury review of one hundred and twelve lesions in nineteen Veterans Administration hospitals, March 1948). The vertical column of figures at the left shows the percentage of cases. The short dashes show the change before streptomycin therapy (three months), the long dashes show the change during streptomycin therapy (four months), and the unbroken line shows the change after streptomycin therapy (average four months).

tion period, although, because of the phrasing of the question, it was impossible to determine whether this improvement was additive or merely a continuation of improvement already started, a suspicion that the for-

mer might be the case led to the jury review of one hundred and twelve lesions in 94 patients, which forms the substance of table 5.

In the cases subjected to this review⁹ there were fifty-eight lesions of the spine and thirty-seven assorted lesions of the extremities. The roentgenograms at the

Fig. 5.—Results of treatment of genitourinary tuberculosis with two regimens of streptomycin (forty-eight Veterans Administration, Army and Navy hospitals, April 1948). The column of figures on the left shows the percentage of cases. The darkened columns indicate a regimen of 1.0 Gm. for one hundred and twenty days (26 cases) and the unshaded columns 1.8 to 2.0 Gm. for one hundred and twenty days (86 cases).

conclusion of treatment, and at the conclusion of a post-treatment observation period averaging one hundred and twenty days, were, in each instance, compared with the pretreatment roentgenograms. It will be observed that, whereas 6 per cent of the lesions were improving and 70 per cent becoming worse prior to streptomycin therapy, a definite reversal of this trend followed the administration of streptomycin; 40 per cent improved during therapy and 70 per cent showed improvement at the end of post-treatment observation. The data are capable of considerably more analysis. It would appear that lesions of the extremities responded somewhat better than those of the spine.

The same radiologic observations of these 94 patients are presented graphically in figure 4, where the shift of the curves to the right during the successive periods of observation illustrates the increasing extent and frequency of improvement during treatment and post-treatment observation.

Consensus.—Partly in view of their own observation, but chiefly in view of the roentgenologic review (table 5 and figure 4), the investigators agreed that streptomycin produced a slow but appreciable improvement in a majority of the tuberculous lesions of bone and joint. The local signs attendant on these lesions improved more rapidly, as would be expected and in a higher percentage of instances. It is planned to repeat the review of these cases at yearly intervals.

It was further agreed to institute the use of streptomycin in combination with surgical procedures in tuberculosis of the bone and joint.

TUBERCULOSIS OF THE GENITOURINARY TRACT

A year ago, bacteriologic studies on a small series of cases of genitourinary disease were incomplete. Now they are complete on a respectably large series, and their completion has increased our optimism in the case of genitourinary disease almost as much as the

9. Conducted on March 6 and 7, 1948, by Dr. Ralph K. Ghormley of the Mayo Clinic and Prof. Edward Evans of the University of Minnesota and their staffs.

observation of delayed roentgenologic changes has reversed our pessimism in the case of bone and joint disease. The results are summarized in table 6 and are illustrated in figure 5. In all 112 patients, the tuberculous causation was confirmed by positive cultures and complete cystoscopic and pyelographic studies were made prior to treatment. Both 2.0 and 1.0 Gm. per day regimens have been used, the latter only since October 1947; in no cases has treatment been completed on 0.5 Gm. dosage.

Symptomatic and cystoscopic improvement, as table 6 and figure 5 indicate, occurred in approximately 80 per cent of the patients during treatment and was much more frequently recorded as "complete" or "decided" than as "moderate" or "slight." The improvement appears to have been quantitatively greater with the 2.0 Gm. than with the 1.0 Gm. per day regimen, but the group with the latter regimen is so much the smaller in size that it seems wiser to avoid drawing such a conclusion at the present time. The pyelograms, on the other hand, were largely unaffected and, except for a uniform healing of scrotal sinuses, a majority of the genital lesions (thirty-three of sixty-three) were either unaffected or worse. The most surprising observation is that conversion by culture was obtained in 83 per cent of the 84 patients for whom these data are available.

Post-treatment observation has been carried on in the larger (2.0 Gm. per day) group for between three and twelve months in 88 per cent of the series and for more than twelve months in an additional 4 per cent. During this period, recurrence of symptoms, of cystoscopic observations and of positive urine culture, occurred in between 14 and 19 per cent of the series; approximately half of these three forms of relapse occurred within the first three months and, one may assume, without being able to determine it from the data, that they occurred in the same group of patients.

Consensus.—There was some surprise that the results were as good as they were reported to be; although the renal lesions visualized by pyelography remained substantially unchanged, cystoscopic improvement, symptomatic improvement and conversion to negative by culture occurred in more than 80 per cent of the patients during treatment, with a relapse incidence of only 15 per cent during a post-treatment observation period that exceeded three months in 92 per cent of the cases. It may be, of course, that the bacteriologic work was inaccurate; it may be that many more relapses will occur; anything may happen.

It was agreed here also to institute combined streptomycin therapy and surgical procedure.

LESIONS OF THE ALIMENTARY TRACT

Seventy patients in this group were reported to the Conference: 38 with ulcerative lesions of the tongue, buccal mucosa, tonsils or pharynx and an additional 32 with enteritis. Lesions of the oropharynx were sometimes diagnosed by biopsy, but a characteristic ulceration, in the presence of sputum proved to be positive for acid-fast bacilli by culture, was regarded as acceptable evidence of tuberculous causation. In the group with enteritis, the diagnosis was, of necessity, presumptive; in only one instance (repeatedly positive cultures of stools and negative cultures of sputum) could it be considered absolute; in the others, it was made on the basis of characteristic symptoms and roentgenographic observations in patients with proved tuberculosis else-

where in the body. The two regimens employed were 2.0 and 1.0 Gm. per day. The intramuscular route was usually employed. The duration of treatment was, usually, between sixty and one hundred and twenty days.

As table 7 indicates, thirty-six of the thirty-eight oropharyngeal lesions healed during treatment.

The clinical results of streptomycin therapy in enteritis, taken together with those in laryngitis and with the early results in meningitis, perhaps best deserve the adjective "dramatic," the use of which has been sedulously avoided thus far. Within a matter of days, the symptoms of pain, tenderness and diarrhea were relieved in all cases. If opiates were in use they could be omitted, and, if the patient was febrile, his temperature was reduced within the week. Eight patients, stated¹⁰ to be characteristic of those who were losing weight prior to treatment, gained from 15 to 40 pounds (7 to 18 Kg.), average 28 pounds (13 Kg.) in the five months following the commencement of streptomycin therapy. Improvements in the roentgenogram have been observed, but are leisurely in making their appearance, and the normal picture is not usually restored. Relapses have occurred following the relief of symptoms, although less often than would be anticipated in face of the frequency with which these patients continue to have a positive sputum culture. The oral administration of streptomycin has not been sufficiently explored to determine its worth, but, if favorable results occur, they are certainly slower in making their appearance than when the drug is injected intramuscularly.

Consensus.—The results are uniformly and remarkably favorable, and tuberculous lesions of the alimentary tract constitute one of the primary indications for streptomycin therapy. This would appear to be another example, already seen in the case of tracheobronchial and laryngeal tuberculosis, of the ease with which lesions of the mucous membrane—as opposed to those of the parenchyma—yield to the attentions of streptomycin.

LYMPHADENITIS

Thirty-six cases of tuberculous lymphadenitis, proved by aspiration or biopsy, were reported to the Conference, and the results of treatment are also summarized in table 7. Equal numbers were treated with the 2.0 and 1.0 Gm. per day regimens, both for one hundred and twenty days, and the results are indistinguishable, one from the other. In 12 patients the glands disappeared; in 18 they became smaller, and in 6 they were unchanged in size.

Because in the earlier series¹ the results had been variable, an attempt was made to distinguish acute lymphadenitis from the chronic form; the duration prior to treatment in the two groups of the present series averaged ten and fifty-six weeks, respectively. Results in acute lymphadenitis were superior in the sense that a larger proportion of the glands disappeared (recorded as "cured" in table 7), but the two groups are scarcely large enough to warrant a conclusion to this effect, however likely it may appear to be. In addition to these 36 cases, in which the glands existed without accompanying sinuses, 51 of the patients reported under the section of this report dealing with cutaneous sinuses, had lymphadenitis as well; 45 of the 51 improved, but the data do not permit a statement as to whether the lesions in these 45 disappeared or merely became smaller.

10. Mason, E. E., and others: Streptomycin in the Treatment of Tuberculous Enteritis, *Am. J. M. Sc.*, to be published.

Consensus.—It was agreed, on the basis of relatively slight experience that lymphadenitis responded reasonably well to treatment with streptomycin.

PERITONITIS

The clinical records of 27 patients, whose disease was diagnosed as tuberculous peritonitis, had been reviewed by the Veterans Administration Hospital, Washington, D. C., preliminary to publication, and an abstract of their observations was reported to the Conference.

In 9 cases, the diagnosis was proved by demonstration of acid-fast bacilli in the peritoneal cavity, either by smear, culture methods, guinea pig inoculation or biopsy sections. The diagnosis was made in 14 cases, in the absence of demonstrable bacilli, by observations in biopsy of characteristic tubercles, usually with frank caseation necrosis. On the basis of peritoneoscopy without biopsy, or of proved tuberculosis elsewhere in the body, 4 cases with clinically typical tuberculous peritonitis were included in this series, although neither bacteriologic nor pathologic confirmation of the diagnosis was obtained. Seventeen patients were treated with the 2.0 Gm. per day and 10 patients on the 1.0 Gm. per day regimen. Twenty-one of the 27 patients received streptomycin for from sixty to one hundred and fifty (usually one hundred and twenty) days, and 6 patients received it for less than sixty days. There was no obvious correlation between regimen and results.

The results (table 7) were regarded as excellent in 19 cases, with subsidence of fever, when present, complete disappearance of ascites, amelioration of abdominal symptoms and striking gain of weight. Post-treatment laparotomies were performed in 3 of these patients. In 1 of them there was striking change in the gross appearance of the peritoneum, but biopsy still revealed tuberculous tissue; in the other 2 cases there was no evidence of persisting tuberculosis. Those who are reported in table 7 as "cured" have had a post-treatment observation period in excess of six months. In some patients who presented multiple tuberculous lesions, the peritonitis responded to treatment as well or better than the other tuberculous manifestations. Three patients who recovered rapidly from the tuberculous peritoneal involvement presented tuberculous lesions elsewhere during or following streptomycin therapy. The condition in 3 additional patients was substantially unchanged during therapy, and 2 became worse, 1 of the 2 dying during a relapse that followed an initially favorable response.

Consensus.—On the basis of this small series, it was agreed that streptomycin seemed to be good medicine for acute and chronic exudative, as well as for adhesive and caseous tuberculous peritonitis.

EMPHYEMA

Thirty-five patients with empyema (but none with pleural effusion) have been treated, without benefit of protocol, with a variety of regimens and by a variety of routes. The only precise statement which can be made about them is that 22 of the 35 were unimproved (table 7).

Consensus.—A further study of this situation with uniform diagnostic methods and treatment schedules is in progress, but the chances for the successful control of tuberculous empyema with streptomycin therapy would appear to be exceedingly remote.

OTITIS MEDIA

The results of treatment in 13 cases were available to the Conference (table 7). The data disclose neither the method by which diagnosis was made nor the regimens which were employed; presumably the only route of administration was intramuscular. Drainage from the offending ear ceased in 11 cases, and in 6 of these perforations of the drum healed.

Consensus.—The number of cases is too small to permit any conclusions, but streptomycin would appear to have been useful.

PERICARDITIS AND LESIONS OF THE EYE AND SKIN

The results in 16 examples of these afflictions are reported in table 7. The individual series are unattractively small and the diagnoses frequently suspect. Since some degree of improvement was reported in 12 instances, these situations would seem to warrant further exploration.

THORACIC SURGICAL PROCEDURES

Since March of 1947, an investigation into the usefulness of streptomycin as a prophylactic in thoracic surgical procedure has been in progress in twenty-seven hospitals. The thought behind the study was that the incidence of postoperative spreads might be decreased if the surgical procedure were performed while the patients were receiving streptomycin. To this end, it was decided to administer streptomycin for seven days prior to each operation (prior to each stage in the case of a multiple stage thoracoplasty) and for fourteen days following it. These periods were chosen arbitrarily, and it could be argued that the duration of preoperative medication was not sufficiently long to reduce sputum volume and was unnecessarily long to establish adequate concentrations of streptomycin in the tissues. Nevertheless, that is what was done. In multiple stage thoracoplasties, it will be observed that this regimen resulted in continuous, or nearly continuous, treatment over considerable periods of time. It was decided to give streptomycin to every alternate patient proposed for thoracoplasty and to withhold it from the other patients to be treated by thoracoplasty. It was decided to give streptomycin to all patients subjected to pulmonary excisions and such other operations as cavernostomies, decortications and open pneumonolyses. The daily dosage was 2.0 Gm. in 64 per cent of the patients who received streptomycin (those operated on prior to October 1947) and 1.0 Gm. in the remainder. The results of the two regimens are indistinguishable from one another.

The results of this study appear in table 8; 1,559 operations have been performed on 709 patients, of whom 460 received streptomycin. The difference in the incidence of spreads between treated (2.0 per cent) and untreated (5.6 per cent) patients with thoracoplasty is statistically significant; in less than 1 out of 150 times could it have occurred by chance; there is a similar difference in the incidence of wound infections between the two groups (1.1 and 2.5 per cent, respectively). The incidence of spreads in one hundred and forty-four pulmonary excisions (lobectomy and pneumonectomy) was 2.8 per cent, and in sixty-eight other thoracic surgical operations it was 3.0 per cent.

Consensus.—It was agreed that, although the prophylactic use of streptomycin had significantly decreased the incidence of post-thoracoplasty spreads,

its routine use was not justified for this operation. This conclusion was based on the low incidence of spreads in the patients that did not receive streptomycin. The data of table 8 support the statement that six hundred and ninety-nine courses of streptomycin were given in order to prevent twenty-two spreads (the difference between fourteen and thirty-six). This not only constitutes a waste of streptomycin but has certain toxic implications and introduces the hazard of producing resistance (referred to subsequently). It was agreed that, in the routine thoracoplasty, it was preferable to withhold streptomycin and give it only if, postoperatively, a spread developed, since spreads treated in this fashion usually respond satisfactorily.

An incidence of only four postoperative spreads following one hundred and forty-four pneumonectomies and lobectomies (2.8 per cent), however, was regarded as so remarkably low that, even in the absence of an untreated series of patients, the value of streptomycin therapy was believed to have been reasonably well demonstrated. It was therefore agreed that the routine use of streptomycin should be continued in these and in other thoracic operations excepting thoracoplasty. This conclusion was influenced by the fact that the operations had been conducted, not by a single surgeon in a single hospital, but by twenty-seven surgeons in twenty-seven hospitals.

TOXICITY

The usefulness of a drug depends on the ratio between its therapeutic efficacy and its toxicity. There are many drugs which might be used to kill many microorganisms, if they did not have the unfortunate side effect of killing the host. As has been repeatedly remarked in the previous sections of this report, and as is rather crudely portrayed in figure 6, there is, with the possible exception of genitourinary tuberculosis, no detectable loss of therapeutic efficacy as the daily dose of streptomycin is reduced from 2.0 to 1.0 Gm. Indeed, although this must be stated more tentatively since

Fig. 6.—Therapeutic efficacy and toxicity with different regimens of streptomycin (forty-eight Veterans Administration, Army and Navy hospitals, April 1948). The column of figures at the left shows the percentage of patients, and the figures at the bottom relate to the regimen. The columns of light shading represent therapeutic efficacy; the columns of dark shading indicates vertigo.

it is based on fewer cases and briefer experience, it would appear that no loss follows a further reduction to 0.5 Gm. It is, therefore, particularly gratifying to find (table 9 and figure 6) that a very definite decrease in toxicity accompanies these reductions in dose. While this reduction might have been anticipated on general grounds, it is important and satisfying to have the point proved.

The more important and conspicuous toxic manifestations have been selected for presentation in table 9. The less important ones, such as nausea and vomiting, paresthesia, contact dermatitis and the like, have been purposely omitted. It will be observed that the more important and the more decided derangements diminish

* These figures differ from those of table 1 because, on the one hand, cases of the military-meningitis and the thoracic operation series have been excluded and because, on the other hand, certain material was suitable for inclusion which had to be omitted from table 1. An error has been deliberately introduced into column 5 (0.5 Gm.) by adding patients who had not yet completed their final sixty days of treatment.

successively from left to right until, under the 0.5 Gm. per day regimen, there are still represented by conspicuous percentages only such minor manifestations as diminished response to caloric stimulation, a decrease in acuity of hearing as observed by audiometer, albuminuria, and eosinophilia. In a negligible series of 8 cases in which treatment has been completed with 0.2 Gm. per day for one hundred and twenty days, there is a column of zeros until one finds the figure "2" opposite eosinophilia.

The individual toxic manifestations have been sufficiently discussed in the previous report¹ and elsewhere.¹¹ Little would be gained by further discussion here. It is most unfortunate that no data were gathered for the Conference concerning the frequency and degree of incapacity which persists in patients who suffered that extraordinarily specific damage to vestibular function which is manifested by vertigo and for which no pathologic basis has thus far been found. Certainly some of these patients still experience difficulty in walking in the dark and would, presumably, be even more seriously incapacitated were they blinded; certainly some of them experience a difficulty in focusing their eyes after sharp movements of the head, which may produce a degree of incapacity and may expose them to such specific dangers as would be encountered in crossing a traffic-crowded street. One general observation may be made in connection with table 9. The important toxic manifestations are, rather generally, less when a daily dose of 1.0 Gm. is divided into two injections (column 4) than when it is divided into

11. Farrington, R. F.; Hull-Smith, H.; Bunn, P. A., and McDermott, W.: Streptomycin Toxicity, J. A. M. A. 134: 679-688 (June 21) 1947.

five injections (column 3). This has led to the suggestion that toxicity is a function of maintained plasma concentrations of streptomycin rather than of occasional peaks of concentration.

In preparing figure 6, vertigo was selected to represent toxic manifestations because of its frequency and importance in the higher dosage regimens. The lightly shaded columns representing therapeutic efficacy are believed to be substantially true, but contain certain inaccuracies: thus, roentgenologic improvement has been arbitrarily taken as an indication of efficacy in pulmonary disease and cystoscopic improvement as the same criterion of efficacy in genitourinary disease; it is also to be remarked that the column representing the 2.0 Gm. per day for sixty days regimen is based almost entirely on cases of pulmonary tuberculosis and that the column representing the 0.5 Gm. per day regimen is based on relatively few cases. Nonetheless, the figure has the virtue of presenting, in rather striking fashion, a relationship which existing evidence would appear to have established.

DEVELOPMENT OF RESISTANCE TO STREPTOMYCIN BY MYCOBACTERIUM TUBERCULOSIS

A second difficulty connected with prolonged streptomycin therapy—a difficulty which, if not peculiar to streptomycin, is at least unusually prominent in its case—is the resistance which tubercle bacilli develop to it. Figure 7 shows the time relationship with which this resistance developed in 2,100 positive cultures. At the beginning of treatment 97 per cent of 745 cultures failed to grow when they were exposed in vitro to 10 micrograms or less of streptomycin per cubic centimeter of medium,¹² and the vast majority failed to grow in 1 microgram per cubic centimeter. After treatment was started, and particularly after it had been continued for thirty to forty-five days, an increasing percentage of positive cultures grew in more than 10 micrograms per cubic centimeter, until, after one hun-

Fig. 7.—Development of resistance by *Mycobacterium tuberculosis* to streptomycin (twenty-three Veterans Administration and Navy hospitals, April 1948). The column of figures at the left shows the percentage of cultures resistant to more than 10 micrograms per cubic centimeter of medium.

dred and twenty days of treatment, about 70 per cent of the cultures did so (fig. 7). A majority of these resistant cultures grew in more than 100 micrograms per cubic centimeter, and many of them in more than

12. This figure is rather arbitrarily selected as a criterion of resistance since it represents the average blood concentration from four to six hours after the intramuscular injection of 0.5 Gm. of streptomycin.

1,000 micrograms per cubic centimeter. Figure 7 is constructed from data obtained from twenty-three laboratories using daily doses varying from 0.5 Gm. to 2.0 Gm. It is not broken down by regimens because the several laboratories are in disagreement as to the differences which changes in dosage produce. It is

Fig. 8.—Results of streptomycin therapy in various tuberculous conditions at the end of treatment (forty-eight Veterans Administration, Army and Navy hospitals, April 1948). The horizontal row of figures at the bottom of the illustration shows the percentage of patients "healed" (notched part of bar) and "improved" (plain part of bar).¹³

believed that the differences are minor and that the form of the curve is substantially the same for all regimens thus far employed. Successive cultures from the same patient usually grow in progressively higher concentrations of streptomycin as treatment is continued. Once resistance is acquired it is apparently "permanent," within the time limits of the study; the occasional instance in which, resistance having been developed, subsequent cultures become again "sensitive" to streptomycin may well be due to a technical error in the determination rather than to a true loss of resistance *per se*; the final answer to this question is not yet available. There is only one recorded instance of a culture of *Mycobacterium tuberculosis* having become dependent on streptomycin to maintain growth.

The vitally important question which this observation poses is whether the observation that tubercle bacilli from a given patient are resistant to, say, 100 micrograms per cubic centimeter in vitro means that all the tubercle bacilli within the patient are similarly resistant and the administration of streptomycin correspondingly useless. In the guinea pig, this question can be answered in the affirmative¹⁴; when animals are inoculated with streptomycin-resistant micro-organisms, they do not respond to treatment with streptomycin and, in fact, appear to die rather more rapidly than do their controls. In human beings, the question cannot be answered definitely at the present time. The answer is not necessarily affirmative; it may be, for example,

13. Steenken, W., Jr.: Resistance: Minutes of the Fourth Streptomycin Conference, St. Louis, Veterans Administration, May 1, 2 and 3, 1947, pp. 52-56. Feldman, W. H.; Karlson, A. G., and Hinshaw, H. C.: Streptomycin Resistant Tubercle Bacilli: Effects of Resistance on Therapeutic Results in Tuberculous Guinea Pigs, *Am. Rev. Tuberc.* LVII: 162-174 (Feb.) 1948.

14. Figure 8 represents an attempt to indicate, graphically, the relative therapeutic effectiveness of streptomycin in various types of tuberculosis. The criteria selected for evaluation of effectiveness are mentioned in each instance, but it should be emphasized that any change in these criteria would decidedly alter both the height and the shading of the individual columns; thus, the acceptance of roentgenologic improvement instead of sputum conversion would increase the "pulmonary" column from 25 to 80 per cent and the inclusion of a post-treatment observation period would nearly double the height of the "bone and joint" column. Its information, therefore, is general rather than specific; its usefulness is qualitative rather than quantitative.

that the inoculum contained a large percentage of sensitive organisms and that an occasional resistant organism was responsible for the observed growth; it may be that the sputum giving rise to the resistant culture was derived from a particular *locus* and that organisms in other *loci* are still sensitive; it may even be that the observation has no merit whatever and that the reaction of micro-organisms to streptomycin is altogether different *in vivo* and *in vitro*. On the other hand, there is an accumulating mass of evidence, no one piece decisive of itself, which indicates that the observation has very real clinical significance and that the observation of a resistant culture—unfortunately, several months later—indicates that further treatment with streptomycin is useless and, conceivably, dangerous. The fact that improvement is most rapid during the first two months, before resistance has developed, argues in this direction, as does the apparent parallelism in timing between the observation of a positive culture and the occurrence of a relapse.

Assuming that the observation has significance, that a resistant culture means a resistant patient, the public health hazard which it involves is rather obvious; all new cases of tuberculosis which are contracted from streptomycin-resistant patients become *ipso facto* unsuitable for treatment with streptomycin. Repeating the assumption, the prime question is then concerned with how to avoid the situation. It cannot be avoided by decreasing the dose within the range thus far studied, and one can scarcely expect to go much below 0.5 Gm. per day without losing therapeutic efficacy. Toxicity prohibits increasing the dose. If it be due to the development of mutants as a result of prolonged exposure to streptomycin, it could be avoided by decreasing the duration of that exposure. If, on the other hand, it be due to the survival and multiplication of a few initially resistant strains, it is difficult to see why shortening the course of treatment to thirty or forty-two days would be of benefit; one would be driven to think in terms of another drug to which these strains would not be resistant. The answer awaits the experiment.

SUMMARY AND CONCLUSIONS

This paper has been in the nature of a second annual progress report on a cooperative investigation which has been carried on by the Veterans Administration, Army and Navy since June 1946. During this period, 2,780 patients with all the tuberculous ills to which flesh is heir (table 1) have completed treatment with streptomycin in forty-eight hospitals. This report has behind it, then, the weight of numbers. It has the advantage of dealing with patients whose diagnoses have been definitely established and who have been treated by uniform regimens. It has the inaccuracies—minor it is believed—which result from material derived by questionnaire.

The most significant practical development of the past year is concerned with new regimens. It has been found possible to reduce the daily dose of 2.0 Gm. for one hundred and twenty days, to 1.0 Gm. for the same period, with a decided reduction in toxicity and without detectable loss of therapeutic efficacy (table 9 and fig. 6). This reduced dosage is as effective when given in two daily injections as in five, suggesting that the supposed necessity of a steadily maintained blood concentration is, in these circumstances, a shibboleth. A further reduction in daily dosage to 0.5 Gm. has been tried in over 100 cases with a definite further reduction in toxic manifestations; it remains to be proved whether there is a concomitant reduction in

efficacy, but, if it occurs, it would not appear to be very significant. A daily dose of 0.2 Gm. is being tried by five hospitals in a group of patients with draining cutaneous sinuses. A reduction in the other regimen factor—that of duration rather than dose—was studied by reducing the duration of treatment to sixty days while maintaining the daily dosage at 2.0 Gm. This also was accomplished without any observable diminution in effectiveness. Observing the practicability of reducing either dosage or duration, the Fifth Streptomycin Conference decided to explore the results of reducing both factors simultaneously and adopted, for the next few months, two regimens which prescribe 1.0 Gm. and 0.5 Gm. daily for forty-two days. The prime question, of course, is how much, or how little, loss of therapeutic efficacy will accompany the adoption of those protocols.

With the disadvantage of toxicity thus alleviated, if not removed, the main bugaboo of streptomycin therapy lies in the development of resistance by the tubercle bacilli to its action. It is this factor which makes one reluctant to give streptomycin for minimal tuberculosis, or any other lesion which may be expected to respond favorably to other forms of treatment, lest one be faced with a life-threatening episode at some time in the future and be unable to use streptomycin with any likelihood of success. The Conference decided to investigate the effect of the shorter (forty-two day) regimen and of combining streptomycin with "promizole" (4,2'-diaminodiphenyl-5'-thiazolylsulfone) and para-aminosalicylic acid and of giving interrupted courses of streptomycin (two weeks "on" and two weeks "off") on the development of resistance. The Conference felt itself to be rather groping in the dark without more fundamental knowledge concerning the nature of the process.

The Conference felt that the indications and contraindications for streptomycin as a prophylactic in thoracic operations had been established during the year. It felt that its judgment concerning the position of streptomycin in the treatment of various types of tuberculosis had been, in most respects, strengthened rather than altered by the experience of the past year (fig. 8). The new evidence adduced in the case of genitourinary and orthopedic tuberculosis made the prospects rather brighter in those fields. In other respects, superficial lesions involving the skin and mucous membranes (i. e., sinus and fistulous tracts, alimentary tract, tracheobronchial tree and peritoneum) continued to heal or to improve remarkably, and, occasionally, to reappear. In miliary and meningeal tuberculosis the early results of treatment continue to be startling, and the late results continue to be much less so. In the main infection, pulmonary tuberculosis, streptomycin therapy in conjunction with bed rest is still regarded as a useful adjuvant to other forms of treatment. Its ability to reverse the trend of progressive exudative lesions has been observed in about 80 per cent of patients treated with all regimens, and this observation has, twice during the year, been confirmed by the judgment of "juries." Occasionally the clearing is complete and streptomycin ranks as definitive therapy. In the great majority of instances the clearing is incomplete and, often, only temporary; in these circumstances, the role of streptomycin would appear to be to make possible the use of collapse procedures which, in the absence of streptomycin therapy, would have had to be delayed or could never have been performed.

On the whole, streptomycin therapy has been helpful.

SATURDAY, OCTOBER 23, 1948

NEW TRENDS IN CANCER CONTROL

While clinical and experimental efforts toward achieving effective control of cancer, through improved diagnostic and therapeutic methods, have had a measured amount of success, the condition is not yet conquered as smallpox and typhoid have been controlled.

The far reaching control of the infectious diseases attained during the past seventy-five years depended on the successful identification of the causative microorganisms and on extensive and laborious epidemiologic studies. As long as the specific causative agents responsible for over 99 per cent of human cancer remain unknown, rapid progress cannot be made.

Although many important and, apparently, fundamental differences exist between infectious diseases and cancer, their similarities also are numerous. Observations as to the number and types of extrinsic carcinogenic factors suggest that exogenous and endogenous carcinogens may include agents differing as widely as those concerned with infectious diseases. The recently discovered species specificity of carcinogenic agents is analogous to the species-specific pathogenicity of microorganisms in infections. The carcinogens, moreover, share with these the differences in pathogenic potency which are characteristic for the individual pathogenic agents.

Paralleling the different reaction products in infectious diseases, and reflecting changes in the reactivity of the tissues of the host to the infecting agent (tuberculosis, syphilis, etc.), extrinsic carcinogens elicit similarly various histologic responses in the host, such as hyperplasia (hyperkeratosis, warts, nodular adenomatoid proliferations), simple tumors and cancers. (Clinical as well as experimental evidence shows that in both infectious diseases and cancer the sites of the anatomic responses are determined not only by the properties of the particular pathogenic agent in question, but also by the type or route of contact with it. The conditions of exposure which decide the development of tuberculo-

sis of the lungs and of the intestine (inhalation and ingestion, respectively) are fundamentally not different from those which are responsible for development of cancer in various sites after exposure to radioactive material by different routes; e.g., skin contact, inhalation, ingestion, parenteral administration.

An additional resemblance between cancer and infectious diseases is the fact that the degree of pathogenicity of the causative agents is only in part an intrinsic quality, as it depends to some extent also on the intensity and duration of exposure to them. Thus, the incidence of cancer of the bladder among workers in dye plants is highest among those most massively exposed to aromatic amines and decreases among other operatives of such manufactures in proportion to the degree to which they come in contact with highly potent carcinogens. Epidemiologic investigations have shown that a similar crowding of tuberculous infection occurs around persons with active and open tuberculosis of the lung. The epidemiologic pattern of the spread of occupational cancer and infectious diseases from foci where their causative agents are generated is similar. For the control of cancer, this fact is of special importance. The progressive march of occupational cancers through all industrialized countries paralleling the development of industries and the continuous creation of new industrial products of often unknown biologic properties are factors which tend to result in the establishment of an increasing number and variety of extrinsic carcinogenic foci. Since the character of a particular carcinogenic agent as well as the type of exposure to it determines the site of the resulting cancer, this development may be followed in the course of time by a change in the quantitative and qualitative aspects of the environmental carcinogenic spectrum, and thereby in the incidence rate of cancer with respect to total numbers and sites in different regions of the country. An effective control of cancer depends on determination of the causes and directions of such trends. The repetition of the survey in ten different metropolitan areas in the United States for cancer morbidity, done first ten years ago and to be done again during this summer by the cancer control branch of the National Cancer Institute, assumes special significance in the light of these considerations.¹

The recent creation of the environmental cancer section within the cancer control branch provides an organization through which the epidemiologic studies are to be supplemented by investigations into the extrinsic causative factors of human cancer as they are related to occupation, medicinal agents, diet, climate, customs, habits and parasitic infections. The third development in this field is represented by a project developed by the New York State Industrial Cancer Committee com-

1. Cancer Control Letter, Federal Security Agency, National Cancer Institute, no. 3, April 23, 1948, and no. 4, May 7, 1948.

posed of representatives of the Division of Industrial Hygiene, New York State Department of Labor, New York State Health Department, the Roswell Park Memorial Institute, Buffalo, and the cancer control branch of the National Cancer Institute. The occupational histories of several thousand patients with cancer seen at the Roswell Park Memorial Institute are to be determined in detail and are to be analyzed for previous occupational cancer hazards sustained by these patients.

ANTI-ANEMIC PROPERTIES OF VITAMIN B₁₂

Shorh¹ in 1947 reported finding in refined liver extracts a factor required by *Lactobacillus lactis* Dorner (L. L. D. factor) which was present in an almost linear relationship to the unit potency of the extracts used in the treatment of pernicious anemia. Rickes² and his associates have isolated from liver a crystalline compound, vitamin B₁₂, and Shorh, who assayed its potency value for *L. lactis* Dorner, considered it to be either wholly or partially responsible for the *L. lactis* Dorner growth activity observed for liver extracts. West³ reported a positive hematologic response in 3 patients with pernicious anemia following the intramuscular administration of vitamin B₁₂ in single doses of 3, 6 and 150 micrograms. Spies,⁴ in 1948, reported on the use of crystalline vitamin B₁₂ in the treatment of Addisonian pernicious anemia in 2 cases, nutritional macrocytic anemia in 2 cases and nontropical sprue in 1 case. In each of the 5 patients there was a striking clinical improvement, which included an increase in their feeling of well-being, mental alertness, strength and vigor and complete relief of the soreness and burning of the mouth and tongue. This was followed by an increase in red blood cells and hemoglobin and in all except 1 case of nutritional macrocytic anemia in white blood cells. One patient with pernicious anemia stated on the fifth day of treatment that the paresthesia and pains of the extremities and physical signs of tenderness and hyperesthesia of four weeks' duration had definitely diminished.

Castle⁵ and his associates treated a patient with pernicious anemia in relapse and acute combined system disease that developed during irregular treatment with synthetic pteroylglutamic acid. A hematologic remission and rapid and decided improvement in the

neurologic picture followed treatment with crystalline vitamin B₁₂. The patient showed severe local and systemic sensitivity reaction to purified liver extracts derived from both pork and beef, but not to vitamin B₁₂. These authors conclude that vitamin B₁₂ should prove effective against the neurologic as well as hematologic manifestations of pernicious anemia. They also suggest that vitamin B₁₂ is not responsible for sensitivity reactions to liver extracts.

Spies⁶ and his associates studied the question of the relation of gastric achlorhydria and subacute combined degeneration of the spinal cord in macrocytic anemias. A two year study of the effect of synthetic folic acid in persons with macrocytic anemia confirmed and extended previous observations that folic acid is an effective anti-anemia substance capable of producing a clinical response of hematologic remission in persons with nutritional macrocytic anemia, tropical sprue and macrocytic anemia of pellagra and pregnancy. However, folic acid will not prevent the development of neural disturbances in persons with Addisonian pernicious anemia. Twenty-eight of the 30 patients in this study who were observed over a period of two years showed subacute combined degeneration. Irrespective of how much folic acid was administered to these persons the condition became worse. Administration of massive liver extract therapy promptly relieved the neural disturbances. In every instance in which subacute combined degeneration of the spinal cord developed in this series, gastric achlorhydria was revealed in repeated tests following histamine stimulation, prior to folic acid therapy. Persons with nutritional macrocytic anemia of tropical sprue or of pregnancy did not have histamine refractory achlorhydria either previous to or during therapy with folic acid, and in no instance did any evidence of subacute combined degeneration develop. In a series of 3 patients with achlorhydria, pernicious anemia and subacute combined degeneration of the spinal cord, all had relief of symptoms after the parenteral injection of 15 micrograms of vitamin B₁₂. The subjective improvement in all 3 patients was remarkable, and in the case in which the disease was most acute there was considerable improvement in all physical signs.

The experiences of these authors suggest that vitamin deficiency diseases tend to be multiple in nature. The administration of a specific vitamin corrects for a deficiency of that vitamin and often aids in improving the general health and well-being of the patient, but it cannot correct a deficiency of all of the essential dietary nutrients.

Current Comment

HEPATIC LOCALIZATION OF EMETINE HYDROCHLORIDE

While emetine hydrochloride is efficient in the treatment of amebic hepatitis, it is less reliable in the treatment of amebic dysentery. Despite its ability to clear up the acute symptoms, relapses frequently occur. A logical explanation of this failure is offered by Palmer,¹ of the Army Medical Center, Washington, D. C., from his study of the topographic distribution of emetine in laboratory animals. Twenty-four albino rabbits each received intramuscularly injections with 6 mg. per kilogram of body weight of emetine hydrochloride. At various intervals after the injection emetine assays were made of the liver and intestinal walls. At the end of one hour 24.9 mg. per kilogram were found in the liver. At this time there was only a concentration of 5.5 mg. per kilogram in the large intestinal walls. The concentration in the liver increased to a maximum of 41.6 mg. per kilogram by the end of twelve hours. The intestinal concentration fell to 1.7 mg. per kilogram by the end of this time. At the end of four days the concentration in the liver was 15.4 mg. per kilogram, while the intestinal concentration had already fallen to 1.2 mg. per kilogram. The intestinal titer became zero by the sixth day and remained at this low level till the end of the experiment (twenty-eight days). The twenty-eighth day reading for the liver was 1.0 mg. per kilogram. This high concentration and prolonged presence of emetine in the liver and low concentration and transient presence in the intestinal wall are offered by Palmer as an explanation for the efficiency of the drug in the treatment of amebic hepatic disease and its relative failure in the treatment of amebic intestinal disease.

NYLON BRIDGE FOR NERVE GAPS

Working with small mammals, Weiss and Taylor² of the Department of Zoology, University of Chicago, developed a new technic for bridging nerve gaps. Connection was made between the nerve stumps by means of a fiber cable embedded in a tubular blood clot. The Weiss technic has been tested on larger animals by Alexander³ and his associates of the Department of Surgery, Harvard University. Five adult *Macaca rhesus* monkeys were operated on by the Harvard group. A section of the tibial nerve was excised from each animal and the nerve stumps allowed to retract. A segment of the internal jugular vein was threaded over the proximal nerve stump. The desired length of the gap was fixed without tension by a tantalum sling stitch. The nerve stumps were then connected axially by a cable of finest nylon fibers. A trough of polyethylene tubing of nerve caliber was placed under the

cable and filled with freshly drawn venous blood. After a firm clot had been formed the trough was removed. The sleeve of the vein was then pulled over the bridged gap and anchored to each nerve stump by a silk stitch. The operative wounds were closed with silk sutures and the animals set free in large cases. Recovery was uneventful. Ten months later the limb was apparently fully restored to functional use. After being freed from moderate adhesions under pentobarbital sodium anesthesia, each bridge presented itself as an elongated swelling of the nerve to one and a half to two times its initial diameter. Electrical stimulation of the nerve above and below the bridge gave in all cases a good contraction of the gastrocnemius, posterior tibial and long flexor muscles of the foot. After severance of the Achilles tendon, there were in 2 cases no perceptible responses of the intrinsic foot muscles, in 2 cases fibrillary twitchings and in 1 case normal contractions of these muscles. Weight of the reinnervated gastrocnemius muscle was on an average 85 per cent normal. Histologic examinations showed that the regenerated distal nerve stumps contained about 90 per cent of their normal quota of fibers. The diameters of the regenerated nerve fibers, however, were subnormal, few reaching the 8 to 9 micra class. While Young³ has expressed the belief that permanently subnormal nerve calibers cause some deficiencies in function, such theoretical deficiencies were not severe enough to be demonstrable in the 5 cases examined. The nerve gaps bridged in the Harvard series varied from 22 to 32 mm. in length. Alexander has expressed the belief, however, that one could lengthen the gaps without making them unbridgeable.

INCREASE IN THE QUANTITY OF MEDICAL CARE

Elsewhere in this issue is a summary of Bulletin 66, on the cost and quantity of medical care in the United States, recently published by the Bureau of Medical Economic Research. Examination of the trends in total consumer expenditures reveals that 4 per cent of the average family budget goes for medical care and that this percentage has been slowly declining in recent years. While the cost of living increased about 59 per cent from the base period 1935-1939 to 1947, the price (fees) of medical care items, however, increased only 32 per cent. Analysis of the average dollar spent for medical care indicates that the physician's share has declined from 32 cents in 1929 to 25 cents in 1947, while that of hospitals has increased from 13 cents to 21 cents during the same period. The bulletin adds to the literature of medical economics a set of estimates showing the phenomenal increase since 1940 in the quantity of medical care rendered the American people. The quantity of medical care has increased much faster than the number of physicians. This increase is particularly significant in the light of current charges regarding the alleged shortage of physicians.

ORGANIZATION SECTION

Official Notes

GRANTS TO AID RESEARCH

The Committee on Scientific Research of the American Medical Association invites applications for grants of money to aid in research in problems bearing more or less directly on clinical medicine. Preference is given to requests for moderate amounts to meet specific needs. As a rule grants are not made for the purchase or acquisition of equipment or apparatus of a permanent nature. For information, address the committee at 535 North Dearborn Street, Chicago 10.

Coming Medical Meetings

American Medical Association Interim Session, St. Louis, Municipal Auditorium, Nov. 30-Dec. 3. Dr. George F. Lull, 535 N. Dearborn St., Chicago 10, Secretary.

Annual Conference of State Secretaries and Editors, St. Louis, Hotel Statler, Nov. 28-29. Dr. George F. Lull, 535 N. Dearborn St., Chicago 10, Secretary.

National Medical Public Relations Conference, St. Louis, Hotel Statler, Nov. 27. Mr. Lawrence W. Rember, 535 N. Dearborn St., Chicago 10, Director.

American Academy of Dermatology and Syphilology, Chicago, Palmer House, Dec. 5-9. Dr. Earl D. Osborne, 471 Delaware Ave., Buffalo, Secretary.

American Academy of Pediatrics, Atlantic City, Chalfonte-Haddon Hall, Nov. 20-23. Dr. Clifford G. Grullee, 636 Church St., Evanston, Ill., Secretary.

American Association of Railway Surgeons, Chicago, Nov. 21-23. Dr. Raymond B. Kepner, 547 W. Jackson Blvd., Chicago 6, Secretary.

American Clinical and Climatological Association, Hot Springs, Va., The Homestead, Nov. 8-10. Dr. James Bordley III, Bassett Hospital, Cooperstown, N. Y., Secretary.

American Public Health Association, Boston, Nov. 8-12. Dr. Reginald M. Atwater, 1790 Broadway, New York 19, Executive Secretary.

American Society for the Study of Arteriosclerosis, Chicago, Hotel Knickerbocker, Oct. 31-Nov. 1. Dr. O. J. Pollak, Quincy City Hospital, Quincy 69, Mass., Secretary.

American Society of Anesthesiologists, St. Louis, Hotel Statler, Nov. 4-6. Mr. John H. Hunt, 188 W. Randolph St., Chicago 1, Executive Secretary.

Association for Research in Nervous and Mental Diseases, New York, Waldorf-Astoria Hotel, Dec. 10-11. Dr. Clarence C. Hare, 700 W. 168th St., New York 32, Secretary.

Association of Military Surgeons of the United States, San Antonio, Texas, Nov. 11-13. Dr. James M. Phalen, Army Institute of Pathology, Washington 25, D. C., Secretary.

Indiana State Medical Association, Indianapolis, Oct. 26-28. Mr. Ray E. Smith, 23 E. Ohio St., Indianapolis 4, Executive Secretary.

International College of Surgeons, U. S. Chapter, St. Louis, Kiel Auditorium, Nov. 16-19. Mr. Ralph E. Osborne, 1516 Lake Shore Drive, Chicago, Business Secretary.

Inter-State Postgraduate Medical Association of North America, International Medical Assembly, Cleveland, Public Auditorium, Nov. 9-12. Dr. Tom B. Throckmorton, 406 Sixth Ave., Des Moines, Iowa, Secretary.

Oklahoma City Clinical Society, Oklahoma City, Biltmore Hotel, Oct. 25-28. Mrs. M. R. Waller, 512 Medical Arts Bldg., Oklahoma City, Executive Secretary.

Omaha Mid-West Clinical Society, Omaha, Hotel Paxton, Oct. 25-29. Dr. John M. Thomas, 1031 Medical Arts Bldg., Omaha 2, Secretary.

Puerto Rico, Medical Association of, Santurce, Dec. 10-12. Dr. J. Basora Deñillo, Box 3866, Santurce, Secretary.

Radiological Society of North America, San Francisco, Dec. 5-10. Dr. Donald S. Childs, 607 Medical Arts Bldg., Syracuse 2, N. Y., Secretary.

Southern Surgical Association, White Sulphur Springs, W. Va., Dec. 7-9. Dr. Alfred Blalock, Johns Hopkins Hospital, Baltimore 5, Secretary.

Southwestern Medical Association, El Paso, Texas, Oct. 28-30. Dr. Wickliffe R. Curtis, First National Bank Bldg., El Paso, Secretary.

Western Surgical Association, St. Louis, Dec. 2-4. Dr. Warren H. Cole, 1853 W. Polk St., Chicago 12, Secretary.

Washington Letter

(From a Special Correspondent)

Oct. 21, 1948.

Flies Becoming DDT-Resistant

Simultaneously with disclosure by Public Health Service that the housefly transmits acute diarrheal disease is presentation of evidence by the Department of Agriculture that resistance to DDT is developing in this insect, at least in certain sections of the country. Latest issue of the weekly *Public Health Reports* carries the results of a two year study conducted in Hidalgo County, Texas, which show that incidence of *Shigella* infections was decidedly reduced in town where there were periodic sprayings of DDT. The rate was unchanged in those towns that were untreated. But when treated and untreated areas were reversed, diarrheal incidence soon became reversed, confirming the theory that fly population bears a close relation to this particular disease problem.

According to the Department of Agriculture, reports from more than twenty-five states indicate that DDT is failing to control houseflies in certain isolated areas. Similar reports have been received from Egypt and Greece. Recent field studies by federal entomologists demonstrated that some strains of flies are now killed with a longer period of contact with DDT. There is still no evidence, however, that a comparable resistance has developed in other species of insect.

Navy Alone Employs 19,000 Disabled Veterans

The naval establishment has about 19,000 disabled war veterans on its payroll, according to an inventory, the findings of which were announced to coincide with "National Employ the Physically Handicapped Week," October 3-9. For example, 16 per cent of the 2,617 civilian employees at the Naval Ammunition Depot in Crane, Ind., are disabled veterans, as are 15 per cent of the 1,730 workers at a similar depot at McAlester, Okla. "There is more public interest today in the physically handicapped than ever before," said Dr. Ross T. McIntire, chairman of the President's Committee, which sponsors nationwide observance of the special week.

Chile Now Eligible for Oak Ridge Radioisotopes

Chile has become the twenty-second foreign nation to qualify as a beneficiary of Atomic Energy Commission's radioisotope distribution program. Sixteen of the twenty-two have already received shipments, the latest being France, consignee of carbon 14, which left Oak Ridge October 1 for use at Laboratoire de l'Institut du Radium, Paris, in cancer research. Newest isotopes to be placed on the Atomic Energy Commission's distribution list are hydrogen 3 and helium 3.

Woman's Auxiliary

1948 CONFERENCE—WOMAN'S AUXILIARY

The fifth annual Conference of the Woman's Auxiliary to the American Medical Association will be held in Chicago, Thursday and Friday, November 4-5, 1948, at the Hotel Sherman. In attendance at the Conference will be the presidents and presidents-elect of the forty-eight county auxiliaries and the national officers and chairmen of standing committees.

Guest speakers will include Dr. Louis Bauer, of New York, Mr. Thomas Hendricks, Dr. Frank G. Dickinson, Dr. Fred W. Hein and Mr. William Doscher of the American Medical Association.

The members of the executive committee of the Board of Trustees of the American Medical Association will be guests of the Conference at luncheon on Friday, November 5.

GOVERNMENT SERVICES

ARMY

HOSPITAL RESERVE UNIT ACTIVATED

The 427th General Hospital, a 1,000 bed hospital reserve unit, has been activated by the Army, under the sponsorship of the University of Illinois College of Medicine, Chicago, and Dr. John B. Youmans, dean of the College of Medicine and a colonel in the Medical Corps Reserve, has been appointed commanding officer.

The class "C" type service unit will consist of a full complement of officers. The commissioned personnel will include 55 medical, dental and administrative officers and 83 nurses. Monthly training periods have been planned for personnel assigned to the hospital. Dr. Youmans has announced that Dr. George V. Byfield has been appointed chief of medical service for the hospital, while Dr. William E. Looby will be chief of the surgical service. Drs. Byfield and Looby are members of the University of Illinois faculty and serve on the staff of the Veterans Administration hospital at Hines, Ill. Others who have been appointed are Victor E. Nicklas, as adjutant, and Joseph W. Harney, as psychologist. The 427th is one of two general hospitals sponsored by institutions in the Chicago area which have been activated. The 297th General Hospital has been organized under the sponsorship of Cook County Hospital.

LOW MORTALITY RATES AND THE NEED FOR PHYSICIANS

The Secretary of the Army, Kenneth C. Royall, announced October 1 that sickness and mortality rates in the Army today are at the lowest peacetime level, a remarkable fact, he said, in view of the worldwide deployment of servicemen, many of whom

are stationed in areas where disease hazards are great. Secretary Royall said that many factors have contributed to this high health level of American troops; for example, the incidence of venereal disease has been reduced to about one half of what it was in 1946, common diseases of the respiratory tract are at their lowest level, and the dysenteries and insect-borne diseases have been less prevalent. These improvements were due largely to preventive medicine practices which have been developed and integrated into the military medical program, including such items as better measures for insect and rodent control, immunization and maintenance of optimum diet.

Secretary Royall also pointed out that, between now and the end of next June, more than 3,900 medical officers will be needed from civilian life to maintain the health of our soldiers. "Never before," he said, "have inducements been greater for doctors to enter the service and never before has the need for them been more vital."

EXHIBIT AT KENTUCKY STATE MEETING

At the annual meeting of the Kentucky State Medical Association in Cincinnati September 27-30, the Army Institute of Pathology presented an exhibit of fifteen panels showing the over-all picture of the Medical Department of the Army and the Air Force. One panel, for example, comprised photomicrographs and descriptive material on the medical effects of atomic radiation. The Air Force panel showed rats that had been flown at an altitude of 8 miles at a speed of 500 miles an hour in order to study the effects of ultrasonic vibration on living organisms.

NAVY

A SYMPOSIUM ON ATOMIC WARFARE

Under the auspices of the Commandant of the First Naval District, a symposium on medical aspects of atomic warfare is held at Harvard Medical School October 15 under the chairmanship of Dr. Shields Warren, Captain, USNR. Among the speakers were Rear Admiral Morton L. Deyo, Commandant First Naval District; Rear Admiral Arthur H. Dearing, Assistant Chief, Bureau of Medicine and Surgery; Dr. Arthur K. Solomon of Harvard Medical School, who discussed "An Introduction to the Field of Nuclear Physics"; Dr. Bernard S. Gould of Massachusetts Institute of Technology, who discussed "Cytotoxicity in Relation to Wound Healing"; Captain John H. L. Heintzelman, USN, "Treatment of Radiation Casualties"; Dr. William Meissner of Harvard Medical School, "Radioactive Isotopes"; Dr. Robley Evans of Massachusetts Institute of Technology, "Effect of Radiation on Genetics"; Dr. Egon Lorenz, National Cancer Institute, "Significance of Small Doses of Radiation on Life Span and Carcinogenesis," and Dr. Shields Warren, "Effects of Radiation."

TOUR OF INSPECTION

Rear Admiral Clifford A. Swanson, the Surgeon General, returned on September 27 from an extended tour of inspection of military installations in Hawaii, Guam, Japan, the Aleutians, Alaska, Seattle and Denver. Admiral Swanson accompanied the Committee on Medical and Hospital Services of the Armed Forces on this tour, together with Rear Admiral Joel T. Boone, executive secretary to the committee, Rear Admiral Paul M. Albright and Lieutenant Commander A. H. Nelson, Administrative Assistant to the Surgeon General.

PERSONALS

Capt. Harry S. Harding, retired, now of Tualatin, Ore., has requested recall to active duty and has been nominated for duty at the Naval Torpedo Station, Keyport, Wash.

Dr. Luman H. Tenney, Princeton, N. J., has been appointed medical officer in command of "Volunteer Medical Division No. 4-23, United States Naval Reserve."

Captain Francis E. Tierney of Stockbridge, Mass., has voluntarily requested recall to active duty and has been nominated to the Board to Review Discharges and Dismissals at the Navy Department, Washington, D. C.

Rear Admiral Carlton L. Andrus, who recently returned from Guam, where he was in command of the Naval Medical Center, has been assigned as district medical officer of the Third Naval District.

The following reserve medical officers have voluntarily requested active duty: Captain Clement C. Troensgaard of Berkeley, Calif.; Commander Mervyn Shoor of Oakland, Calif., and Lieutenant Commander Charles W. Morrison of Lancaster, S. C.

AWARDS AND COMMENDATIONS

Captain Joseph Logue

The Presidential Unit Citation was awarded to Capt. Joseph B. Logue, MC, now of Arlington, Va., for service with the First Marine Division, Reinforced, during the period September 15-29, 1944, in action against the Japanese forces at Peleliu and Ngesebus in the Pacific Ocean area. Captain Logue was graduated from the University of Georgia School of Medicine, and entered the service in 1917.

VETERANS ADMINISTRATION

MALARIA AMONG VETERANS

The Veterans Administration announced September 15 that thousands of veterans who contracted malaria during World War II have been cured and that the problem of relapse from war-acquired malaria will be an insignificant one. The Veterans Administration records show that about 503,000 veterans were receiving compensation for malaria during June 1947; nine months later this number had dropped to 32,000, and it is still declining together with the number of relapses. While the malaria parasite eventually "burns itself out" in human bodies in one to three years (some persons are known to have remained infected for as long as twenty years), good results have been obtained from the use of the drugs chloroquine, pamaquine and the recently synthesized 8-aminoquinolines.

THE MEDICAL STAFF

The Veterans Administration announces that its medical staff now includes nearly 15,000 full time physicians, dentists and nurses, nearly 2,000 residents, 2,000 part time physicians, 475 consultants and 310 attending physicians. In addition,

thousands of civilian doctors working on a fee basis are available to eligible veterans in almost every community of the nation. With this medical care goes free prescription service for drugs and social service home visits when necessary and authorized.

HOSPITAL NEWS

Ground has been broken for the new 200 bed veterans hospital at Phoenix, Ariz., to cost more than \$4,000,000. Ground has been broken for the veterans hospital at Saginaw, Mich., which is expected to cost about \$4,500,000.

The Veterans Administration has approved the acquisition of 200 acres of Fort Funston, Calif., for a new 1,000 bed neuro-psychiatric hospital. No funds will be involved in the transfer of this tract, as it was recently declared excess to the Army's needs. This property is bounded on the south by the city limits of San Francisco and on the west by the Pacific Ocean.

An addition has been planned to the Wichita hospital's administration building. The regional offices of the Veterans Administration in this area are at present occupying space in an aircraft plant but must vacate next spring.

PUBLIC HEALTH SERVICE

APPOINTMENT OF SCIENTISTS IN THE REGULAR CORPS

An examination for appointment in the regular corps of the U. S. Public Health Service in the grades of Assistant Scientist and Senior Assistant Scientist will be held in the near future.

The Regular Corps of the Public Health Service is a commissioned officer corps composed of members of various medical and scientific professions. An appointment in the Regular Corps provides an opportunity for a qualified scientist to pursue his profession as a life career in association with others having similar training and interests. Possible assignments include research in the National Institute of Health, Bethesda, Md., and research or operational work in such Public Health Service installations as the Water and Sanitary Investigation Station, Cincinnati, the Communicable Disease Center, Atlanta, Ga., and the various Marine Hospitals.

Applicants for the assistant grade must (1) be citizens of the United States and at least 21 years of age, (2) possess earned doctor's degrees in a natural or social science from a university of recognized standing and (3) have had at least seven years of educational and professional training and experience, exclusive of high school. It is permissible for one to be admitted to the examinations within the nine month period

prior to the anticipated fulfillment of stated requirements. Applicants for the senior assistant grade must meet requirements for the assistant grade and must have had at least ten years of educational and professional training and experience, exclusive of high school.

Examinations will be given in the following subjects: aquatic biology, bacteriology, biochemistry, chemistry, entomology, mycology, parasitology, physics, physiology, psychology and protozoology.

Entrance pay (exclusive of benefits) for the assistant grade with dependents is \$3,811 per year and for the senior assistant grade with dependents \$4,351 per year.

Each qualified applicant will be given a physical examination by a medical officer of the Public Health Service. He will also receive written examinations and will appear before a board of commissioned officers for an interview. Written examinations in each field will be of a degree of difficulty comparable with that of examinations generally given to candidates for the Doctor of Philosophy degrees in the universities.

Application forms and additional information may be obtained from the Public Health Service Hospitals and district offices or by writing to the Surgeon General, United States Public Health Service, Washington 25, D. C.

MISCELLANEOUS

WARNING—PROCAINE SOLUTION

The Federal Food and Drug Administration warns physicians and dentists that certain codes of procaine hydrochloride solution manufactured by C. B. Kendall Company, Indianapolis, cause severe necrotic damage on injection. A batch of the solution coded 24830 was placed in distribution in February 1948. The Kendall Company determined, following reports of untoward reactions, that the solution is highly acid, possessing a pH of about 1. The company attempted to recall the lot, but the recall program has not been completely effective.

The Food and Drug Administration has learned that another batch of the firm's procaine hydrochloride solution coded 64712 has caused several alleged necrotic reactions. The pH of a vial of this lot was found to be 2.9. Pharmacologic work being performed by the Administration indicates that these two products are dangerous and should not be used. They have been distributed in the area from Florida to Wisconsin and from West Virginia to Texas. C. B. Kendall Company has distributed several other lots of injection drugs which possess

a pH of 3.0 or less. Of these, the firm has voluntarily recalled the following products on which complaints have been received: vitamin B complex, stronger, lot 54843; vitamin B complex, lot 44832; pentabexin, lots 44823 and 54837, and thiadoxin, lots 34808, 44817 and 64842.

Also, the following injection products of C. B. Kendall Company have shown low pH values as indicated:

Product	Lot. No.	pH Value
Vitamin B complex stronger.....	64844	2.9
Vitamin B complex.....	54811	2.8
Thiamine hydrochloride	34817	2.6
Thiamine hydrochloride	74806	2.9
Pyridoxine hydrochloride	74725	2.7
Pentabexin	64812	3.0
Procaine hydrochloride	74871	3.0

The Council on Pharmacy and Chemistry of the American Medical Association first called the Administration's attention to reports from physicians of injurious effects following use of the procaine solution.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CALIFORNIA

Narcotic Violation.—Dr. Frances Evelyn McNealy, 116 Temple Street, Los Angeles, pleaded guilty at Los Angeles to issuing fraudulent narcotic prescriptions contrary to state law and on July 20 was sentenced to 100 days in the county jail or a fine of \$350.

Imposter Turns Business Over to Chiropractors.—John R. Osborne, 56, pleaded guilty in Los Angeles to practicing medicine without a license, September 9, and was fined \$200. According to newspaper reports, he was operating a health emporium in Los Angeles, specializing in washing out the colon. Police said that his profits were as high as \$1,500 a day. In his probation report Osborne said that he had turned his business over to licensed chiropractors. In 1925 he had been sentenced to ten years in Federal prison and fined \$12,000 for using the mails to defraud in the promotion of Valhalla Burial Park in Burbank.

University Establishes Cancer Institute.—The University of California Medical Center in San Francisco has established a Cancer Research Institute. Dr. Robert S. Stone, professor of radiology, has been appointed acting director with Dr. Ralph L. Byron Jr., instructor in surgery and oncology, as assistant director. A full time director will be appointed later. Eventually the institute will be housed in specially designed quarters at the university's new medical center on the San Francisco campus. The state legislature appropriated funds for the new hospital and medical school buildings, and the U. S. Public Health Service has pledged \$1,000,000 for the additions needed to house the institute.

COLORADO

Personal.—Dr. Ruth B. Thomas Howard, formerly with the U. S. Public Health Service, has been appointed to the maternal and child health division of the state health department. Dr. Howard is a graduate of Columbia University College of Physicians and Surgeons, New York, and has practiced medicine in Maine and New Jersey.

State Medical Election.—At the annual meeting of the Colorado State Medical Association September 22-25 Dr. Casper F. Hegner of Denver was installed as president and Dr. Fred A. Humphrey of Fort Collins was made president-elect. Dr. George R. Buck, Denver, was elected constitutional secretary for a three year term. Dr. William H. Halley of Denver was reelected as senior delegate to the American Medical Association, with Dr. Kenneth C. Sawyer, of Denver, as alternate. The 1949 session will be held in Denver September 21-24.

DISTRICT OF COLUMBIA

Good Neighbor Gift to University.—Three physicians of Puerto Rico who received their medical education at the George Washington University School of Medicine have made a "good neighbor" gift of \$1,000 to the university in behalf of the 38 physicians now practicing in the Territory who are graduates of the school. Physicians pointed out that the gift was made in appreciation and because of the "tragic need for doctors" in Puerto Rico. They stated that only about half of the 100 government medical scholarships are filled because of overcrowding in the United States medical schools, and that government-built hospitals of Puerto Rico are unable to operate at full capacity because of the shortage of doctors.

ILLINOIS

Postgraduate Conference in Monmouth.—The third postgraduate conference planned by the postgraduate education committee of the Illinois State Medical Society will be held at the Elks Club, Monmouth, October 28, following a luncheon. The following Chicago speakers will participate:

Henry Poncher, Pediatric Therapeutics.
Arkell M. Vaughn, Vagus Nerve Resection in Treatment of Peptic Ulcer.
Theodore R. Van Dellen, Rheumatic Heart Disease.
Eugene A. Hamilton, Fractures.
Percy E. Hopkins, Acute Abdominal Emergencies.

A round table discussion will conclude the afternoon's program. Dr. Hopkins will speak at the dinner on "Prepayment Medical and Surgical Care" and Dr. Harry M. Hedge on "Birthmarks."

Teachers for Prospective Parents.—The Illinois Department of Public Health is sponsoring two in-service training courses in the administration, organization and teaching of classes for prospective parents. Scheduled for October 18 and 19 at the LaSalle Hotel in Chicago and for October 21 and 22 at the St. Nicholas Hotel in Springfield, these courses are open to physicians, nurses, nutritionists, school administrators and community leaders in health and welfare organizations. Authorities in the field of parent education will participate in the sessions. Emphasis will be placed on care for pregnant mothers and the value of guidance to parents in the care of small children.

Chicago

Grant to Epilepsy Clinic.—The Junior League of Chicago, Inc., has presented a \$13,000 grant to the University of Illinois College of Medicine toward the support of the Consultation Clinic for Epilepsy. The clinic, which is operated by the University's department of psychiatry at the Illinois Neuropsychiatric Institute, is under the direction of Dr. Frederic A. Gibbs.

Chemistry and Biologic Problems.—A series of eight lectures on "Applications of Organic Chemistry to Biologic Problems" are being given by Alexander R. Todd, Ph.D., visiting professor of biochemistry at the University of Chicago, in room P117 of Albert Merritt Billings Hospital of the University of Chicago, for eight consecutive Fridays, beginning October 8. Dr. Todd is professor of organic chemistry at Cambridge University, Cambridge, England.

Funds to Expand Mental Hygiene Clinics.—The Advisory Committee to the Mental Hygiene Section of the Chicago Department of Health recently approved the allocation of \$24,175 in federal funds to expand psychiatric and mental hygiene clinics in Chicago. Clinics at Mercy, Provident, Presbyterian, and Women and Children's hospitals will receive allocations to be used primarily for demonstration purposes. The money is being made available to extend existing psychiatric and mental hygiene services. Funds are provided through the National Mental Hygiene Act for the development of local mental hygiene programs.

Recommendations of Health Survey Committee.—The Committee on the Chicago-Cook County Health Survey will seek to expand the health protective activities of the Chicago-Cook County Health Department in 1949 by the addition of 50 public health nurses, 25 sanitary inspectors, 12 dentists and 3 dental hygienists to the Chicago Health Department. The committee has also recommended the development of the division of nutrition, health education, mental hygiene, geriatrics and adult hygiene and public health statistics, as well as a beginning of the district health center system. The committee pointed out that the Chicago Health Department should have in 1949 about 175 additional personnel, professional and clerical, and a total of \$600,000 additional in 1949 to cover their salaries, equipment and expenses and to provide for pay adjustments. Regarding the Cook County Department of Public Health, the committee has suggested that recommendations made be divided over four years. Recommendations are being made for about 40 additional personnel, professional and clerical, in 1949; joint operation with the city of the vital statistics program to save funds and improve efficiency; strengthening of the housing programs, especially in the improvement of inspection services; a more aggressive rodent control program, and improved garbage collection and disposal. The committee, which is sponsored by the Health Department and by the Council of Social Agencies in Chicago, was formed to work toward the adoption of the many recommendations of the Health Survey made last year by the U. S. Public Health Service for the improvement of health facilities of the metropolitan areas.

MASSACHUSETTS

Clinic Fellowship Available.—The Boston Dispensary has available a fellowship in medicine for clinic and domiciliary service. Additional appointments will be made July 1, 1949. Fellowships are approved by the American Board of Internal Medicine in satisfaction of graduate training. The salary is \$1,800 per year without maintenance or \$1,200 with maintenance. Automobile required. Address Frank E. Wing, Director.

Boston University Centennial.—The Boston University School of Medicine is celebrating its centennial anniversary October 22 and 23 in the Charles Hayden Memorial Building. A Colloquium of Medical Sciences began Friday afternoon. Out of state speakers included:

Dr. Carl F. Cori, St. Louis, Some New Aspects of the Action of Insulin.
Dr. Andrew C. Ivy, Chicago, Enterogastromy.
Dr. Helen B. Taussig, Baltimore, Md., Methods of Diagnosis of Congenital Malformations of the Heart.
Dr. George W. Corner, Washington, D. C., Benjamin Rush and His System of Medicine.

MICHIGAN

Foster Foundation Awards.—The Foster Foundation Committee on Medical Prizes, Grand Rapids, announces the winners in the contest for medical papers published in recognized state and national medical journals prior to Jan. 1, 1948. Papers were judged by a committee made up of members of the University of Michigan faculty. The winners, all Grand Rapids physicians, were: (1) Robert M. Eaton, "Pulmonary Edema," \$250; (2) William H. Veenboer and Henry P. Kooistra, "Vaginal Hysterectomy with Radical Advancement of the Uterosacral Ligaments for Pelvic Floor Hernioplasty in Cases Showing Third Degree Uterine Prolapse," \$100; Aymer M. Hill and Jerome E. Webber, "Serum Phosphatase Values in Children Showing Retardation in Osseous Development and Low Metabolic Rates," \$100; John T. Hodgson and Charles H. Frantz, "Arrest of Growth of Epiphyses," \$50.

Charles Herrick Celebrates 80th Birthday.—The eightieth birthday of Charles J. Herrick, Sc.D., was celebrated at the Kent Country Club, Grand Rapids, October 9. Among those in attendance were: Basil Harvey, M.B., emeritus dean of medical students, University of Chicago; George Bartelmez, Ph.D., professor of anatomy, University of Chicago; Davenport Hooker, Sc.D., editor, *Journal of Comparative Neurology*, University of Pittsburgh; Elizabeth C. Crosby, Ph.D., professor of anatomy, University of Michigan, Ann Arbor; Reuben Strong, Ph.D., emeritus professor of anatomy, Loyola University, Chicago; Drs. Paul C. Bucy and Gerhardt von Bonin of the University of Illinois, Chicago, and Dr. Normand L. Hoerr of Western Reserve Medical School, Cleveland. Dr. Herrick is emeritus professor of anatomy of the University of Chicago and for fifty-four years was on the editorial board of the *Journal of Comparative Neurology*.

MISSOURI

Visiting Professor.—Dr. Warren Andrew, professor of anatomy at George Washington University School of Medicine, Washington, D. C., has been appointed the visiting professor of anatomy at Washington University School of Medicine in St. Louis for a six month period beginning September 1. Dr. Andrew is substituting for Mildred Trotter, Ph.D., who is on a year's leave of absence.

Physical Medicine Award.—Dr. Frank H. Ewerhardt, St. Louis, received the Golden Key Award of the American Congress of Physical Medicine at a meeting in Washington, D. C., September 9, "in recognition of long and distinguished contributions" to physical medicine. Dr. Ewerhardt is assistant professor of physical therapeutics at Washington University School of Medicine, St. Louis.

NEW HAMPSHIRE

Society News.—The New Hampshire Pediatric Society has chosen Dr. Thomas B. Walker, Portsmouth, as president and Dr. Ursula G. Sanders, Concord, secretary-treasurer.

No Typhoid in Manchester.—According to the health officer of Manchester no death from typhoid occurred in that city from 1935 to date, and no case of typhoid occurred from 1936 through 1945. One case developed in 1946 in a man who ate raw clams from a polluted area.

NEW JERSEY

Personals.—Dr. Richard E. Shope, Kingston, member of the Rockefeller Institute for Medical Research, has been appointed associate director of the Merck Institute for Therapeutic Research. Dr. Shope is the recipient of the Alvarenga Prize and the John Phillips Memorial Award in 1937 and the John Scott Award in 1943.—Dr. Delma W. Caldwell, formerly an associate in medicine at Northwestern University Medical School, Chicago, has been appointed medical director of Standard Oil Development Company, research affiliate of the Standard Oil Company. Dr. Caldwell is a graduate of Rush Medical College, Chicago, 1941.

NEW YORK

Postgraduate Lectures.—The Medical Society of the State of New York in cooperation with the New York State Department of Health has arranged a postgraduate lecture for the Tompkins County Medical Society at the Hermann M. Biggs Memorial Hospital, Ithaca, November 15 at 8:30 p. m. Dr. George N. Edson, New York, will speak on "Medicolegal Aspects of Trauma." On December 14, Dr. Paul A. Bunn, Syracuse, will address the Clinton County Medical Society, at the Champlain Valley Hospital Nurses' Home, Plattsburg, at 8:15 p. m., on "Problems in Physical Diagnosis."

Grants Support Rheumatic Fever Research.—The New York State Masons gave a \$200,000 grant September 21 to seven colleges and universities for research in rheumatic fever as the initial gift in their long range program. The institutions receiving the grants from the Masonic Fund for Medical Research and Human Welfare were Columbia University College of Physicians and Surgeons, New York; New York University-Bellevue Medical Center; Cornell University Medical School and Arthritis Clinic at New York Hospital, New York; Irvington House, Inc., Syracuse University Medical School, Syracuse; University of Buffalo School of Medicine and University of Rochester School of Medicine. Additional grants will be made January 1.

New York City

Women's Medical Association.—At the fall meeting of the Women's Medical Association of New York City, October 27, at the Beekman Tower Hotel, Dr. Martha M. Eliot, associate chief, Children's Bureau, Washington, D. C., will speak on "The World Health Organization."

Expand Medical Center's Teaching Program.—The New York University-Bellevue Medical Center announces that its teaching program for practicing physicians will be expanded to include ten hospitals instead of the seven included during the past year. The program is designed to bring to suburban and rural nonteaching hospitals the advantages of a working relationship with the University Medical Center (THE JOURNAL, Aug. 30, 1947, p. 1559). Additional hospitals from the New York area will probably be affiliated with the Medical Center during the academic year. Hospitals participating last year will again have affiliation. Since the plan was inaugurated a year ago, requests have been received from more than fifty hospitals. The plan is financed by the W. K. Kellogg Foundation.

Delafield Cancer Hospital.—The cornerstone of the six story Francis Delafield Hospital for cancer at 163rd Street and Fort Washington Avenue, Manhattan, was laid September 21. Mayor O'Dwyer was the principal speaker, with brief addresses by Charles P. Cooper, President of Presbyterian Hospital; Dr. Willard C. Rappleye, Dean of the College of Physicians and Surgeons, and Commissioner Frederick H. Zurmühlen of the Department of Public Works. This new city hospital is expected to be completed in August 1949, at a cost of \$6,200,000, with additional expenditure of \$800,000 for equipment and furnishings. It will memorialize Francis Delafield, distinguished New York pathologist and physician (1841-1915), who worked at Bellevue Hospital and Columbia University. The Francis Delafield Hospital is the second cancer hospital being constructed by the city. With the 300 bed James Ewing Memorial Hospital, begun last year, overcrowding will be relieved in the City Cancer Institute on Welfare Island and the Brooklyn Cancer Institute. The agreement among the city, Columbia University and Presbyterian Hospital, is that the purpose of the new hospital will be "to provide care and treatment of inpatients and outpatients with cancer or other neoplastic disease and to establish research into the causes, prevention and methods of diagnosis and treatment of cancer as well as to provide for the education of physicians, medical students, dentists and others in various aspects of cancer."

PENNSYLVANIA

Society News.—At the meeting of the Reading Eye, Ear, Nose and Throat Society September 15, Dr. Lewis K. Elfman, Philadelphia, chief in otolaryngology, Philadelphia General Hospital, spoke on "Lingual Tonsils."

Philadelphia

Personals.—Dr. Gilbert M. Bayne, a graduate of the University of Pennsylvania School of Medicine, 1947, has been appointed as assistant medical director of Sharp & Dohme, Inc.—Dr. Wilbur H. Strickland was appointed medical director of the Mercy-Douglas Hospital.

Allergy Meeting.—The annual scientific meeting of the Philadelphia Allergy Society will be held at the Philadelphia College of Physicians October 27 at 8:30 p. m. Dr. Jean Crump will speak on "Use of Amino Acids in Eczema in Children," Dr. Howard C. Leopold on "Effect of Benadryl on the Hematopoietic System" and Drs. I. George Blumstein and Jay Spiegelman on "The Philadelphia Program for Ragweed Extermination."

Hospital University Agreement.—Agreement in principle has been reached on the ultimate combination of the clinical facilities of the Department for the Sick and Injured of the Pennsylvania Hospital and the teaching hospital of the Graduate School of Medicine of the University of Pennsylvania.

sylvania. Such a program would contemplate the erection of a central service building at the Pennsylvania Hospital, Eighth and Spruce streets, the ultimate vacating of the Graduate Hospital buildings, the consolidation of the staffs and the establishment at the Pennsylvania Hospital of the major teaching service for the Graduate School of Medicine.

TEXAS

Course on Tumors.—A Tumor Postgraduate Course is being offered at the University of Texas School of Medicine, Galveston, October 25-28. Subjects to be discussed include neoplasms of the lymphoid system; tumors of the thyroid and esophagus; mediastinal tumors and cysts, and tumors of the trachea, bronchi and lungs. Guest speakers will be Drs. William E. Adams, Chicago; John V. Goode, Dallas, Texas; Harry Hauser, Cleveland; Clyde A. Stevenson, Temple, Texas; Arthur P. Stout, New York; Shields Warren, Boston, and Don C. Weir, St. Louis.

Grants for Research.—Among the grants received by the University of Texas Medical Branch, Galveston, are \$9,400 from the National Foundation for Infantile Paralysis, Inc., to assist studies on polio virus, under the direction of Morris Pollard, M.S., director of the Virus Laboratory. The Office of Naval Research has granted \$10,000 for a two year period for the support of the research on the tropical rat mite in relation to its role as vector of filariae, under the direction of J. Allen Scott, Sc.D., professor of epidemiology. The Upjohn Company of Kalamazoo, Mich., has made a grant of \$3,000 to the university to support research on antibiotics under the direction of Dr. Edgar J. Poth, professor of surgery and director of the Surgery Research Laboratory, and Lederle Laboratories of Pearl River, N. Y., has renewed a grant of \$2,500 to the University to support studies on rickettsial diseases.

WISCONSIN

Personal.—Dr. Ira F. Thompson, Beloit, was elected president of the state board of health at its July-August meeting. He succeeds Dr. Gunnar Gundersen, La Crosse, who was recently elected to the Board of Trustees of the American Medical Association.

County Societies Requested to Establish Emergency Service.—All county medical societies have been asked by the State Medical Society of Wisconsin to take "immediate steps to assure the public that it will be able to secure medical attention at night or in emergencies." The Council of the society has requested that all county societies, groups of physicians, or physicians and hospitals having any arrangement for night or emergency service already in operation take steps to explain their existence and operation to the public through the newspapers and radio stations.

Hearing Tests of School Children.—The Committee on Hearing Defects of the State Medical Society reports that it has tested 7,126 school children in several demonstration areas and found that 8 per cent had a hearing loss. Of this number 106, or 1.5 per cent, were selected to be given examinations at clinics sponsored by the local county medical society. Of these, 80 were sent to their family physicians for follow-up and treatment, and 21 others were advised to obtain hearing aids. In the past year efforts have been concentrated in a half dozen counties, with plans to expand the program later to the rest of the state.

ALASKA

Public Health Appointment.—Dr. Duncan M. Chalmers, Hale Center, Texas, has been appointed director, Division of Tuberculosis Control, Alaska Department of Health, succeeding Dr. Leo J. Gehrig, now of Boston. Dr. Chalmers was graduated from Boston University School of Medicine in 1934. He has been chief of the outpatient department and station allergist with the Veterans Administration at Batavia, N. Y., and county health officer and school physician in the Fairport District, N. Y.

CANAL ZONE

Organize Gynecology and Obstetrics Society.—The Sociedad Panameña de Ginecología y Obstetricia (Panamanian Society of Gynecology and Obstetrics) has recently been organized with Dr. G. García de Paredes as president and Dr. Julio A. Lavergne as secretary. The society hopes to promote the highest possible level of efficiency in the practice of the specialty and to collaborate with similar societies of other countries for an exchange of scientific information, statistical data and other activities.

GENERAL

Society Election.—At the recent meeting of the American Hospital Association in Atlantic City, John N. Hatfield, administrator of Pennsylvania Hospital, Philadelphia, was chosen president-elect, and Joseph G. Norby, Milwaukee, assumed the office of president. Dr. Arthur C. Bachmeyer, director of clinics, University of Chicago, was reelected treasurer.

Cerebral Palsy Film Production.—The National Association of American Business Clubs will raise \$25,000 for the production of an educational film on cerebral palsy. The film, which will be produced by the National Society for Crippled Children and Adults, will be available to interested persons and groups. The American Business Clubs adopted cerebral palsy as a national project in 1927. Lawrence J. Linck, Chicago, is executive director of the society.

Climatological Association Meeting.—The American Clinical and Climatological Association will hold its annual meeting at the Homestead, Hot Springs, Va., November 8-10, under the presidency of Dr. Francis M. Rackemann, Boston. Among the speakers will be Dr. Hans Selye, director of the Institute of Experimental Medicine and Surgery, University of Montreal, Canada, who will give the Gordon Wilson Lecture on "The General-Adaptation Syndrome."

Symposium on Feelings and Emotions.—The second International Symposium on Feelings and Emotions will be held October 28-30 by the Loyal Order of Moose with the cooperation of the University of Chicago. The sessions on October 28 will be held at Mooseheart, Ill., and the rest at the University of Chicago. The symposium is under the general chairmanship of Martin L. Reymert, Ph.D., director of the Mooseheart Laboratory for Child Research, Mooseheart, Ill., with Dr. Anton J. Carlson, professor emeritus of physiology, University of Chicago as honorary chairman.

Resolution on Animal Experimentation.—The Executive Committee of the American Association for the Advancement of Science, meeting in Washington, D. C., September 15, passed a resolution reaffirming its conviction that animal experimentation is essential for progress in the biologic and medical sciences. The association, regarding with apprehension the activity of certain groups which are attempting to prevent the use of unclaimed animals for study in qualified institutions of biologic medicine, believes that a supply of animals for research and teaching purposes should be assured, by legislation or ordinance where necessary, and not be left to the option of the local pound officials and private groups.

Chemical Society Awards.—The American Chemical Society has awarded Dilworth W. Woolley, Ph.D., an associate of the Rockefeller Institute for Medical Research, New York, the \$1,000 Eli Lilly & Company Award in biologic chemistry in recognition of his research on vitamins and antivitamins. Dr. Woolley received the Eli Lilly award in bacteriology in 1940, and the American Pharmaceutical Manufacturer Association conferred its first research award on him last April during the meeting in Havana. The \$1,000 Paul-Lewis Laboratories Award in enzyme chemistry was given to Albert L. Lehninger, Ph.D., assistant professor of biochemistry with the department of surgery at the University of Chicago for research in the chemistry and metabolism of fatty acids.

Heart Association to Expand.—The American Heart Association has formulated plans to expand community programs to combat heart diseases throughout the country and strengthen existing associations. Requests for the development of additional heart associations have been received from forty cities and states. According to Dr. Charles A. R. Connor, medical director, local affiliates are vitally needed to direct and coordinate a wide range of services in the prevention, care and treatment of heart disease including encouragement of proper hospital and follow-up care, development and improvement of cardiac clinics and coordination and extension of vocational training and employment programs for cardiac patients. A Research Allocations Committee is to be elected by the Scientific Council of the association to develop the continuing research program.

Impostor Poses as Representative of A. M. A.—An impostor representing himself as a field representative of the American Medical Association for the purpose of inspecting hospital laboratories has been operating in and around New York City. After completing his task he asks the hospital to cash small checks drawn on the First National Bank of Seattle, in which city he claims residence. Checks have been returned marked "unable to locate account." This man calls himself variously Dr. Rumerick, Dr. Haff or Dr. Alex O. Hoff. The New Jersey Hospital Association has described "Dr. Hoff" as "short, slightly built, height 5 feet 9 inches, weight 140 pounds, and of sallow complexion." He is reported as having a mus-

tache and brown hair parted in the middle and wearing glasses. Accredited representatives of the American Medical Association never call at a hospital to inspect without having had previous correspondence with the hospital. In case of doubt, contact The Council on Medical Education and Hospitals, American Medical Association, 535 N. Dearborn, Chicago.

Panamerican Medico-Social Congress.—The second Panamerican Medico-Social Congress will be held in Lima, Peru, December 3-10, under the auspices of the Peruvian government. Subjects to be discussed include: coordination of plans of public health and social assistance in all Latin-American countries, the social problem of cardiac patients, study of the participation of the medical profession in social security and social insurance, interchange professional practice of physicians, laws concerning the insane and coordination of plans for medical studies in Latin-American countries. Those planning to attend may obtain information from Gilberto Morey Sotomayor, Secretary, Second Panamerican Medico-Social Congress, Asociacion Medica Peruana Villalta 218, Apartado 926, Lima, Peru.

International Society of Hematology.—The first formal Congress of the International Society of Hematology was held in Buffalo, New York, August 23-26, with more than 700 persons representing 20 nations attending. This society is an outgrowth of the International Rh and Hematology Conference held in Dallas, Texas, and Mexico City in 1949. The next meeting will be held in 1950 in Cambridge, England. The officers elected for the next two years are: Sir Lionel Whitby, regius professor of physic, Cambridge University, Cambridge, England, president; Dr. Marcel Bessis, Laboratoire de Recherches, 53 Boulevard Diderot, Paris, France, secretary general (Europe); Sol Haberman, Ph.D., Baylor University Hospital, Dallas, Texas, secretary general (Western hemisphere), and Dr. Martin Hynes, department of medicine, Cambridge University, Cambridge, England, secretary-treasurer of the congress.

Incidence of Poliomyelitis.—The U. S. Public Health Service reports a total of 1,527 cases of poliomyelitis for the week ended October 2, as compared with 1,608 the previous week and 1,840 for the next earlier week (the highest weekly figure this year). This week's figure brings the total to date to 19,179, as compared with 7,290 in 1947 and 18,502 in 1946 for the corresponding period. The principal current increases occurred in New York, Ohio and South Dakota. The largest numerical decreases occurred in Minnesota, New Jersey, Pennsylvania, Nebraska, Kansas, Texas and North Carolina. The incidence in California declined from 310 to 307. As both the cumulative total of reported cases to date and the current week's figure are above the corresponding figures for 1946, this year's total may be expected to equal, if not exceed, that for 1946 (25,196). The preliminary case fatality rate in both North Carolina and Los Angeles is about 4 per cent. Assuming no significant change in virulence, the fact that, in recent years, the death rate for poliomyelitis has not increased in comparable measure with the incidence rate would indicate the reporting of a larger proportion of cases of mild nonparalytic disease in recent years.

National Board of Medical Examiners.—At the annual meeting of the National Board of Medical Examiners the number of candidates taking the various parts of the examination was reported at a record high. The following new members were elected to the board: Dr. Russell L. Haden, Cleveland, who was nominated by the Council on Medical Education of the A. M. A.; Dr. Paul B. Magnuson, Washington, D. C., medical director of the Veterans Administration; Dr. Winfred Overholser, professor of psychiatry, George Washington University, Washington, D. C.; Dr. James V. Warren, professor of physiology, Emory University, Atlanta, Ga.; Dr. Hugh R. Leavell, assistant director of Harvard School of Public Health, Boston, and Dr. Eugene A. Gillis, Washington, D. C., who succeeded Dr. Warren Draper, Washington, D. C., as a second representative from the U. S. Public Health Service. The officers elected were Dr. Borden S. Veeder, St. Louis, president; Dr. J. Stewart Rodman, Philadelphia, medical secretary, and Mr. Everett S. Elwood, Philadelphia, executive secretary and treasurer. It was decided that the next annual meeting should be held at the time and place of the annual session of the A. M. A.

Academy of Pediatrics.—The annual meeting of the American Academy of Pediatrics will be held at Chalfonte-Haddon Hall, Atlantic City, N. J., November 20-23, under the presidency of Dr. John A. Toomey, Cleveland. Included in the many round table discussions is a discussion on present day attitudes toward breast feeding and among the panels one on rheumatic fever. In a symposium on congenital cardiac disease held Monday morning Stanley Gibson, Chicago, will discuss "Congenital Heart Disease from the Standpoint of the Pediatrician"; Helen B. Taussig, Baltimore, Md., "Differential Diagnosis of Mal-

formations Which Cause Persistent Cyanosis with Special Emphasis on Those Amenable to Surgery"; Richard J. Bing, Baltimore, Md., "Role of Catheterization of the Heart and Other Physiological Methods in the Diagnosis of Congenital Heart Diseases"; John D. Keith, Toronto, Canada, "Angiocardiography in Congenital Heart Disease," and Alfred Blalock, Baltimore, Md., and Willis J. Potts, Chicago, "Surgical Management of Congenital Cardiovascular Anomalies." A Latin American session will be held Saturday at 8 p.m. under the direction of Dr. Félix Hurtado, Habana, Cuba, at which the speakers will be Drs. Jesús Lozoya Solís, México, D.F.; Ernesto G. Cofiño, Guatemala, Guatemala; and J. G. Bengochea, Dr. Hurtado and Arturo J. Aballi, Habana.

The Lasker Awards.—Winners of the 1948 Lasker Awards of the American Public Health Association for outstanding contribution in the fields of medical research and public health administration were announced October 6 as follows: Selman S. Waksman, Ph.D., of Rutgers University, New Brunswick, N. J., and René J. Dubos, Ph.D., of the Rockefeller Institute for Medical Research, New York, jointly, for "studies of the antibiotic properties of soil micro-organisms," and in Dr. Waksman's case also for the discovery of streptomycin; Vincent du Vigneaud, Ph.D., Cornell University Medical College, New York, "for studies of transmethylation and contributions to the chemistry of biotin and penicillin."

For outstanding administrative achievement Lasker Awards will be presented to Dr. Martha M. Eliot, associate chief, U. S. Children's Bureau, Washington, D. C., "for organization and operation of the Emergency Maternity and Infant Care Program, and to Dr. Rolla E. Dyer, director, National Institute of Health, Bethesda, Md., "for organization and administration of the Research Grants Division of the National Institute of Health of the U. S. Public Health Service." The Lasker Group Award for this year will be presented to the Department of Medicine and Surgery, Veterans Administration, and especially Dr. Paul R. Hawley, its former chief medical director, and Dr. Paul B. Magnuson, chief medical director, "in recognition of the efficient program developed by them to provide modern medical care for the millions of veterans who helped in the defense of America during World War II." The awards consist of \$1,000 each, and a gold replica of the classical statue, The Winged Victory of Samothrace, used in this instance as a symbol of victory over death and disease, for individual winners, and a silver statuette for group award winners. A leather-bound citation, hand illuminated in the style of the Middle Ages, accompanies each award. Formal presentation will be made November 11 at the American Public Health Association's annual banquet in Boston.

CORRECTION

Amberlite.[®]—In the answer to the query in THE JOURNAL, Sept. 25, 1948, page 330, it is stated that the anion exchange resin is still limited to investigational use, whereas it has been available for about a year as resinat.[®] The term "amberlite IR IV" was used in the answer. The anion exchange resin used in resinat[®] is a polyamine formaldehyde resin, sometimes designated as "amberlite XE 58."

Marriages

RICHARD D. RIDER, Riverside, Ill., to Miss Constance Lila Beebe, in Montreal, Que., Canada, June 18.

CLAUDE GIBSON HOOTEN JR., Lynchburg, Va., to Miss Martha Anne Jackson of Dade City, Fla., June 20.

KENNETH L. COOLEY, Rochester, N. Y., to Mrs. June Stone McKillen at Canandaigua, N. Y., June 19.

JOHN VERNON HUMMEL, Charleston, Mo., to Miss Barbara Jo Walker of Memphis, Tenn., June 26.

GORDON C. G. THOMAS, Charlottesville, Va., to Miss Barbara MacDonald of Darien, Conn., June 12.

PARK WEED WILLIS III, Seattle, to Miss Christine Boone Weaver of Philadelphia, June 5.

MARTIN DE FOREST SMITH JR., New York, to Miss Patricia Green of Islip, N. Y., in June.

WILLIAM F. BINKLEY, Sidney, Ohio, to Miss Jacqueline P. Benfer of Columbus, in June.

JOHN L. MCCLANAHAN, New York, to Miss Rita S. Bullitt of Oxmoor, Pa., June 5.

ISAAC S. COE to Miss Sybil Tedford McGee, both of Clarksdale, Miss., June 26.

Deaths

Herschel Frank Connally ☉ Waco, Texas; born in McGregor, Texas, Jan. 6, 1878; Vanderbilt University School of Medicine, Nashville, Tenn., 1900; served as chairman of the board of councillors, for many years councillor of the Twelfth District, past president and vice president of the State Medical Association of Texas; past president of the McLennan County Medical Society; in 1927 appointed to the state board of medical examiners, serving as chairman of the reciprocity committee for many years, and at the time of his death as secretary of the board; member of the board of directors of the Federation of State Medical Boards; fellow of the American College of Surgeons; during World War I was sent overseas as chief of surgical service of Base Hospital number 90, serving first as a major and then as lieutenant colonel; formerly city commissioner, mayor of Waco and member of the board of directors of the Chamber of Commerce; first chief of staff at the Hillcrest Memorial Hospital, where he was a member of the surgical staff; on the staff of the Providence Hospital; since 1931 consulting surgeon at the Veterans Administration Hospital; medical examiner of the Amicable Life Insurance Company and for many years local surgeon for the Missouri-Kansas-Texas Railroad; died July 16, aged 70, of coronary occlusion.

Anatole Kolodny ☉ New York; born in Kazan, Russia, Nov. 23, 1892; received Ph.D. degree from University of Basel, Switzerland, in 1912, and M.D. from the Imperial University of Kazan Faculty of Medicine, Russia, in 1917; formerly on the faculty of his alma mater and assistant in pathology at the Pathological Institute in Berlin; at one time on the faculties on the State University of Iowa College of Medicine in Iowa City and the University of Illinois College of Medicine in Chicago; resident in neurosurgery at Johns Hopkins Hospital in Baltimore in 1926 and 1927; member of the American Association of Pathologists and Bacteriologists, American Association for Surgery of Trauma and the American Association for Advancement of Science; fellow of the American College of Surgeons; during World War I served with a Russian battalion attached to the French Army and also on Turkish and Western fronts as a regimental physician; had been decorated with the Cross of St. George for bravery in the Imperial Russian Army in the field; served on the staffs of Beth-El Hospital and the Hospital for the Aged, Brooklyn; author of monographs dealing with pathology and surgery; died July 8, aged 55, of carcinoma of the esophagus.

Nelius Julian Nessa ☉ Sioux Falls, S. D.; born in Preble, Minn., Nov. 3, 1880; University of Minnesota College of Medicine and Surgery, Minneapolis, 1905; past president of the South Dakota State Medical Association and the Sioux Falls Seventh District Medical Society, specialist certified by the American Board of Radiology; member of the House of Delegates of the American Medical Association from 1943 to 1945; fellow of the American College of Radiology; member and since 1920 councillor of the Radiological Society of North America; member of the American Roentgen Ray Society; served as a first lieutenant in the medical corps during World War I; member of the Selective Service Board during World War II; past president of hospital staffs and senior radiologist to the McKennan and Sioux Valley hospitals; died in Rochester, Minn., July 2, aged 67, of acute leukemia.

Samuel McCullagh, New York; born in Philadelphia, Feb. 21, 1876; University of Pennsylvania Department of Medicine, Philadelphia, 1898; specialist certified by the American Board of Otolaryngology; member and formerly vice president of the American Laryngological Association; member of the American Laryngological, Rhinological and Otolological Society; fellow of the American College of Surgeons; established a medal and sufficient funds to endow it at the New York Academy of Medicine; received the Distinguished Service Cross for services in France during World War I; consulting laryngologist to the Manhattan Eye, Ear and Throat Hospital; died July 21, aged 72, of chronic cardiac valvular disease.

Frederick Whitney Davis, Chinchilla, Pa.; born on Feb. 24, 1874; Jefferson Medical College of Philadelphia, 1898; member of the American Medical Association; formerly secretary of the Lackawanna County Medical Society; received citations from the Serbian and Yugoslavian governments for his services against a typhus epidemic in the Balkan states after World War I, during which time he served overseas; at one time medical director of the Lackawanna County; served on the staffs of West Side Hospital, Moses Taylor Hospital and St. Joseph's Children's and Maternity Hospital; died July 31, aged 74, of heart disease.

Frank Joseph Anderson ☉ Minneapolis; University of Minnesota Medical School, Minneapolis, 1917; joined the regular U. S. Navy; served during World Wars I and II; on the staff of the Deaconess Hospital, where he died June 25, aged 58, of cerebral hemorrhage and hypertension.

Thomas Arneson, Almena, Wis.; College of Physicians and Surgeons, Keokuk, Iowa, 1898; member of the American Medical Association; served during World War I; died June 29, aged 78, of epithelioma of the penis.

Paul Beauchamp, Science Hill, Ky.; Chattanooga (Tenn.) Medical College, 1896; died in June, aged 78, of heart failure.

James Wesley Benham, Columbus, Ind.; Louisville (Ky.) Medical College, 1896; member of the American Medical Association; served during World War I; died June 26, aged 79, of coronary occlusion.

Luthard N. Bergh ☉ Montevideo, Minn.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1906; on the staff of Montevideo Hospital; division surgeon for the Chicago, Milwaukee and St. Paul Railway; died June 2, aged 67, of coronary disease.

Frank Simons Bissell, Los Angeles; University of Minnesota College of Medicine and Surgery, Minneapolis, 1902; at one time on the faculty of his alma mater; served as vice president of the Radiological Society of North America; accidentally killed June 27, aged 69, while crossing a road in Glendale.

Edwin A. Blakeley, Sanford, Mich.; Saginaw (Mich.) Valley Medical College, 1903; died June 11, aged 78, of arteriosclerosis and cerebral hemorrhage.

John C. Blinn, Bellefontaine, Ohio; Homeopathic Hospital College, Cleveland, 1884; died in New Philadelphia June 14, aged 92, of myocardial infarction.

Warren Oscar Christenson, Wellsville, Utah; Rush Medical College, Chicago, 1915; member of the American Medical Association; served as vice president of the Utah State Medical Association; formerly mayor; secretary and past president of the Wellsville-Menton Conservation District; died June 20, aged 76, of heart disease.

Willard Olin Clark ☉ Lewiston, Idaho; Kansas Medical College, Medical Department of Washburn College, Topeka, 1912; fellow of the American College of Surgeons; past president of the Idaho State Medical Association; served during World War I; affiliated with St. Joseph's Hospital; died June 1, aged 62, of cerebral hemorrhage, hypertension and arteriosclerosis.

Ella Jane Collins, Linesville, Pa.; Cleveland Medical College, Homeopathic, 1895; died June 16, aged 91, of auricular fibrillation.

Knox Rose Freytag, Oakland, Calif.; Northwestern University Medical School, Chicago, 1946; entered the medical corps, Army of the United States, as a first lieutenant on Jan. 28, 1947; later promoted to captain; stationed at Letterman General Hospital in San Francisco; honorably discharged; died May 5, aged 27.

Philip Hallock, Beverly Hills, Calif.; University of Minnesota Medical School, Minneapolis, 1929; formerly on the faculty of his alma mater; member of the American Medical Association and Central Society for Clinical Research; fellow of the American College of Physicians; served during World War II; died in Los Angeles June 29, aged 45, of coronary occlusion.

James Jones Hudgins ☉ Paragould, Ark.; University of Arkansas School of Medicine, Little Rock, 1912; died June 12, aged 59, of melanoma-sarcoma of the right eye.

James Edgar Hunt, Inglewood, Calif.; Maryland Medical College, Baltimore, 1909; died June 20, aged 67, of acute pulmonary edema.

Richard Bush Hunter, Winchester, Ky.; Medical College of Ohio, Cincinnati, 1897; died in the Clark County Hospital, June 13, aged 74, of coronary heart disease.

Charles F. Judson, Wynnwood, Pa.; University of Pennsylvania Department of Medicine, 1893; formerly on the staffs of Lankenau and Children's hospitals in Philadelphia; died June 3, aged 79.

Robert James Lynch ☉ Des Moines; Northwestern University Medical School, Chicago, 1906; member of the American Academy of Ophthalmology and Otolaryngology; specialist certified by the American Board of Otolaryngology; on the staffs of the Iowa Lutheran, Iowa Methodist and Mercy hospitals; died May 28, aged 67, of coronary thrombosis.

John H. Lewis, Dawson, Ga.; Atlanta Medical College, 1893; member of the American Medical Association; died June 25, aged 84, of arthritis and uremia.

William Hill Lewis, Siloam, Ga.; Atlanta School of Medicine, 1908; member of the American Medical Association; died June 29, aged 65, of heart disease.

William Lipschitz, New York; Long Island College Hospital, Brooklyn, 1915; died June 17, aged 64.

John Clarence McGrath, Nelsonville, Ohio; Ohio Medical University, Columbus, 1898; died June 20, aged 78, of arteriosclerosis.

Aloysius Patrick Nachtwey † Dickinson, N. D.; Milwaukee Medical College, 1912; member of the House of Delegates of the American Medical Association from 1936 to 1947; past president and secretary of the Stark County Medical Society; died June 29, aged 59.

John Robert Owens, North Canton, Ohio; Western Pennsylvania Medical College, Pittsburgh, 1897; member of the American Medical Association and the Medical Society of the State of Pennsylvania; died June 6, aged 76.

Carl Wilhelm Paulson, Los Angeles; University of Minnesota Medical School, Minneapolis, 1916; died in the Veterans Administration Center, West Los Angeles, June 27, aged 63.

George Tompkins Pomeroy † Sonoma, Calif.; Oakland College of Medicine and Surgery, 1906; served overseas during World War I; formerly director of the Veterans Home Hospital in Veterans Home; died June 20, aged 71, of coronary occlusion.

Henry Buron Powell, Gadsden, Ala.; University of Alabama School of Medicine, 1910; member of the American Medical Association; physician for Republic Steel Corporation; served during World War I; died in Baptist Memorial Hospital, June 24, aged 64, of cerebral thrombosis.

Daniel Lewis Rectenwald, Pittsburgh; Western Pennsylvania Medical College, Pittsburgh, 1903; also a graduate in pharmacy; died in St. Joseph's Hospital July 8, aged 69, of pneumonia and thrombophlebitis of the common iliac veins.

Arthur Augustus Reeder, Portageville, Mo.; Vanderbilt University School of Medicine, Nashville, Tenn., 1901; member of the American Medical Association; for many years member of the board of education; died July 25, aged 73, of heart disease.

James S. Reynolds † Minneapolis; University of Minnesota College of Medicine and Surgery, Minneapolis, 1905; fellow of the American College of Surgeons; past president of the Minnesota Academy of Ophthalmology and Otolaryngology and the Hennepin County Medical Society; affiliated with St. Barnabas Hospital; was shot and killed July 8, aged 68.

Compton Riely † Baltimore; University of Maryland School of Medicine, Baltimore, 1897; clinical professor of orthopedic surgery at his alma mater; specialist certified by the American Board of Orthopaedic Surgery; member of the American Orthopaedic Association; affiliated with the Cambridge-Maryland Hospital, Cambridge, University Hospital and Franklin Square Hospital; attending surgeon on the staff of Kings Daughters Hospital in Martinsburg, W. Va., where he died June 27, aged 76, of lobar pneumonia and coronary thrombosis.

Percy Jay Ross, Chicago; State University of Iowa College of Medicine, Iowa City, 1926; member of the American Medical Association and the American Academy of Ophthalmology and Otolaryngology; specialist certified by the American Board of Otolaryngology; served as a lieutenant colonel in the medical corps, Army of the United States, during World War II; senior otolaryngorhinologist at St. Luke's Hospital; died at his home in La Grange, Ill., September 28, aged 46, of carcinoma.

Stephen Sampson Royster, Shelby, N. C.; Tennessee Medical College, Knoxville, 1891; chairman of the Cleveland County Board of Commissioners; for many years affiliated with Shelby Hospital; formerly served as a member of the city council and as president of the chamber of commerce; died July 13, aged 80, of angina pectoris.

Carl Gustaf S. Rydin, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1902; veteran of the Spanish-American War and World War I; died in Veterans Administration Hospital in Downey, Ill., July 30, aged 74, of pneumonia and arteriosclerosis.

Hiram Sibley Schumacher † Rochester, N. Y.; Johns Hopkins University School of Medicine, Baltimore, 1907; affiliated with the Genesee Hospital, where he died July 14, aged 69, of bronchogenic carcinoma.

Rollin Robb Shannon † Williamsport, Ind.; Stanford University School of Medicine, San Francisco, 1933; member of the

Utah State Medical Association; served during World War II; on the staff of the Community Hospital; was killed near Ross-ville, Ill., July 14, aged 44, in an automobile accident.

Bohumil Sladek, Cicero, Ill.; College of Physicians and Surgeons of Chicago, 1892; died July 24, aged 77, of cerebral hemorrhage.

Herbert Frederick Spierling † Chicago; Northwestern University Medical School, Chicago, 1925; member of the staff of the Jackson Park Hospital, where he died July 3, aged 53, of hypertension and chronic bilateral nephrosis.

David Ellicott Squiers, Scotts, Mich.; University of Michigan Medical School, Ann Arbor, 1903; died at Pickeral Lake, July 20, aged 69, of carcinoma of the stomach.

James Bodine Stalker, Indianapolis; University of Louisville (Ky.) Medical Department, 1898; member of the American Medical Association; served overseas during World War I; for many years physician for the Federal Court; on the staffs of the Methodist Hospital and St. Vincent's Hospital, where he died July 6, aged 72, of coronary occlusion.

Thomas Gordon Sutherland † Auburn, Wash.; George Washington University School of Medicine, Washington, D. C., 1927; affiliated with the Auburn General Hospital; director of the Bank of Auburn; died in the Virginia Mason Hospital, Seattle, July 4, aged 50, of cardiovascular renal disease.

Ollie Herbert Treadway, Pittsfield, Ill.; University of Missouri School of Medicine, Columbia, 1893; died in the Illini Community Hospital, July 14, aged 87, of coronary thrombosis.

William Carl Treder † Schenectady, N. Y.; Albany Medical College, 1907; past president and secretary of the Schenectady County Medical Society; formerly on the faculty of the Syracuse University College of Medicine; for many years city health commissioner; served as assistant pathologist and bacteriologist for Onondaga County, for many years health officer of Glenville, county coroner and school medical inspector for free school district number 2, town of Glenville; died July 20, aged 68.

George Loughlin Tully, Newton, Mass.; Harvard Medical School, Boston, 1916; served during World War I; died July 1, aged 58, of carcinoma.

William Chester Vernon † Okmulgee, Okla.; St. Louis University School of Medicine, 1916; served during World War I; medical examiner for Okmulgee county draft board during World War II; formerly affiliated with the Indian Service; part owner of the Ming-Vernon Hospital; affiliated with Okmulgee City Hospital; died July 17, aged 55, of melanop-epithelioma.

Samuel Charles Wagner, Elkhart, Ind.; Medical College of Indiana, Indianapolis, 1903; member of the American Medical Association; served during World War I; formerly county coroner; on the staff of the Elkhart General Hospital, where he died July 27, aged 73, of congestive heart failure.

James Knight Wardwell, Boston; Harvard Medical School, Boston, 1905; served on the staff of the Massachusetts Woman's Hospital; died July 29, aged 67, of heart disease.

Herbert Baker Whitney, Denver; Harvard Medical School, Boston, 1882; professor of medicine emeritus at the University of Colorado School of Medicine; member of the American Clinical and Climatological Association; past president of Colorado State Medical Society; died in St. Luke's Hospital, July 3, aged 91, of coronary thrombosis.

Alfred Wiener † New York; College of Physicians and Surgeons, medical department of Columbia College, New York, 1889; member of the American Academy of Ophthalmology and Otolaryngology; affiliated with the Montefiore and St. Luke's hospitals; died July 21, aged 81, of arteriosclerosis.

Sard Wiest, Portland, Ore.; Gross Medical College, Denver, 1892; member of the American Medical Association; died July 6, aged 80, of coronary thrombosis.

Francis Marion Wilks, Tulsa, Okla.; University of Oklahoma School of Medicine, Oklahoma City, 1910; died in a local hospital July 12, aged 75.

Rilie Edward Williams, Cuyahoga Falls, Ohio; Starling Medical College, Columbus, 1898; died July 9, aged 76, of coronary occlusion.

Alfred Herman Winkel † Stanwood, Wash.; Washington University School of Medicine, St. Louis, 1911; fellow of the American College of Surgeons; served on the staffs of King County, Swedish, Providence and Columbus hospitals in Seattle; died in Camano Island July 11, aged 61, of carcinoma of the prostate.

The Minister of Health and the National Health Service

Speaking at the annual dinner of the Society of Medical Officers of Health, Mr. Bevan, the Minister of Health, was very optimistic about his achievement. He regarded the present year as memorable "because it had witnessed the great Health Act." There was a section of the community more harassed than any other by the possibility of surgical and hospital bills—the middle and professional classes. He had feared that unwholesome propaganda might persuade them to stand outside the Act. That danger was past. The last figures indicated that between 92 and 93 per cent of the population had already signed up with their doctors. They were coming in now at the rate of 150,000 a week, and it appeared that by the end of the year practically 100 per cent of the population would be in. He was delighted. This meant that the health service would be a classless service and every section of the community would be in full enjoyment of its benefits.

There had been complaints from some quarters about the number of spectacles that had been supplied. The only misgiving he had was that now nearly everybody would be able to read some of the nonsense that had been written about the Act. It was to be expected that in the first year there would be a rush for some of the facilities, but that would settle down when the novelty wore off. He was delighted to see that the dentists were now coming in more quickly. In his self congratulation the Minister did not reply to any of the criticisms of the Act. Their validity will soon be put to the test. One question may now be asked. If 100 per cent of the population, or something near it, are coming under the Act, where is the private practice, which many doctors believed would be preserved? What about the freedom of the doctor to work under the Act or in private practice as he preferred? If the Minister is correct, private practice can continue on only a very limited scale.

Streptomycin Treatment of Tuberculosis

The Ministry of Health has issued an important statement on the streptomycin treatment of tuberculosis, so that all who are likely to use the drug should be aware of its limitations and dangers. Clearly streptomycin is not a panacea.

The production of streptomycin-resistant strains of *Mycobacterium tuberculosis* is the greatest potential danger. Thus a patient with very early pulmonary disease who might have responded to other recognized forms of treatment alone, but who is given streptomycin prematurely, may be found, in the event of relapse or extension of the disease, to be beyond the reach of streptomycin therapy. There is a risk of persons with old chronic cases spreading infection with streptomycin-resistant strains, so that patients acquiring meningeal or miliary tuberculosis from them cannot hope, in their turn, to be benefited by streptomycin. However, the value of the treatment is considered so great that beds in two categories, (a) tuberculous meningitis and acute miliary tuberculosis and (b) tracheobronchial tuberculosis, are being allotted in hospitals all over the country.

Do We Eat Too Much?

Prof. A. Fleisch, president of the Swiss Federal Commission for Nutrition, caused a stir in the physiologic section of the British Association for the Advancement of Science by stating that we are eating too much. He claimed that the United Nations' minimum standard of 2,400 calories a day is too much and that 2,160 is sufficient for all except heavy manual workers.

The calory level of the British diet is 2,800. He based his conclusions on a large scale experiment made with scientific thoroughness on 4,000,000 persons in Switzerland. This showed that the amount of calories, proteins and fats considered essential in civilized countries is utterly unnecessary. One gram of protein daily per kilogram of body weight is quite sufficient. The world is imbued with the idea that an agreeable taste goes hand in hand with nutritional value. But Fleisch's experiment disproves this. A large part of the meat and eggs eaten before the war and of the refined fats, sugar, white bread and macaroni could have been replaced by vegetables, fruit and darker bread. Today, when great nations are suffering from hunger it is absolute waste if large quantities of wheat are converted into eggs, with the loss of 90 per cent of the nutritive value. In Switzerland potatoes were added to flour and large quantities of skim milk were drunk. Eggs were rationed to one or two a month; the blood of slaughtered animals was used for sausages; fat was made from substances normally used for soap, and other fats were extracted from bones, tobacco seed and beech nuts. Linseed oil, instead of being used to paint houses, was eaten mostly in dehydrated form. It did not taste good but was easily digested. As a result there were no queues at the food shops. These are now normal all over Britain.

Artificial Insemination

A commission appointed by the Archbishop of Canterbury and consisting of clerics, physicians and lawyers has presented its report. All the members agreed that "assisted insemination," as a sequel to normal or attempted normal intercourse between husband and wife, may be justified. With one clerical member dissenting, the commission also found that, when assisted insemination is inapplicable or ineffective, other methods of using the husband's semen may be employed, even if there is no practical alternative to masturbation. All the members, except another cleric, agreed that artificial insemination with donated semen brings about a breach of the marriage; it violates the exclusive union between the husband and wife, defrauds the child begotten and deceives both his putative kinsmen and society at large. For donor and recipient the sexual act loses its personal character and becomes a mere transaction. For the child there must always be the risk of disclosure. With the same member dissenting, the commission judged the use of donor semen to be wrong in principle and contrary to Christian standards.

Food Consumption in France from 1940 to 1947

It is only now that the results of the various investigations, started in 1940, are brought up to a definite point by the Nutrition Section of the National Institute for Hygiene. J. Tremolieres and G. Pequignot and his co-workers have conducted tests, under the form of enquiries in families and groups. All the food-stuffs consumed during one week were weighed according to a method recommended by Professor Bigwood; food composition charts developed by the combined working committee of the United States and the United Kingdom were used (and for Paris those of Madame Randoïn). From 1940 to 1945, four principal alimentary groups were noted: (1) Marseilles and the Mediterranean region, where the consumption of calories falls to 1,500, the proteins to 15; (2) Paris and Lyons: calories a little higher; proteins, 20 Gm.; (3) rich rural regions: calories, 3,000; proteins, 35 Gm.; (4) industrial cities of secondary importance: alimentation slightly richer than in Paris and Lyons. Differences in mortality corresponding to these groups are noted. In the Mediterranean area and for the period 1940 to 1944, the mortality rate was increased by 50 per cent in com-

parison with 1936 to 1938; in Paris and Lyons (Seine and Rhone) by 20 to 30 per cent (persons over 70, children under 4 and those from 10 to 19 are the most affected); in the rich rural regions the rate diminished by 10 to 20 per cent; the decrease is more accentuated in 1945. This decrease is conspicuous among persons aged 20 to 69 and especially with respect to deaths from tuberculosis. Since the third quarter of 1946 improvement in the food supply has occurred, but, as the improvement has been in foodstuffs not subjected to taxation, it results in a great inequality in the distribution, the coefficient of variation being 50 per cent for animal proteins and 36 per cent for lipids.

Nutritional Unbalances.—Madame Randoin, a member of the National Academy of Medicine, has just explained that unbalances are mostly due to deficiencies in animal proteins, animal and vegetable lipids, calcium, vitamin C (during the winter months) vitamins of the B₂ group, and especially nicotinic acid and vitamins A and D. The dairy products (milk, butter, rich cheeses) are those that have been most lacking the last eight years. Children over 4 years of age, adolescents and old persons receive milk only from time to time; other adults, with the exception of expectant and nursing mothers, never have any.

Growth Disorders.—In 1944 the maximum stunting of 14 year old girls in stature was 11 cm. and of 14 year old boys 7 cm. (the weight of the latter was 8.6 Kg. below normal). In 1945, Tremollieres and his co-workers made a survey of 40,000 children in nine urban centers; these children also were almost normal in height until they were 9 to 10 years old; the deficiency increased rapidly until the age of 14 years, when girls, on the average, were 7 cm. below normal in height and 5 Kg. in weight, and boys were 4 cm. and 6 Kg. below normal. Surveys of 150,000 children during the academic year 1946-1947 show a general improvement, the predominating departure from the normal occurring at the ages from 13 to 15. As a rule, subnormal weight is more noticeable in boys, subnormal stature in girls. There are great differences according to social classes. Among the poor, boys are 2 cm. and 3 Kg. below normal at the age of 13 to 14; while 14 to 15 year old girls are 2.5 to 4 cm. below normal. A delay in puberty has been found. As a matter of fact, it is the rapid growth before puberty that has been affected by underfeeding; less extreme disorders among girls than in boys show that the female organism is more adaptable.

Disorders in Thermogenesis.—Saidman, before the war, drew attention to the study of the average surface temperature, measured at thirty-three specified points on the cutaneous surface. Since 1941 he has found that, as the result of underfeeding, there is a fall of the surface temperature of the body, more noticeable than that of the internal one. The author and his co-workers tested 200 Parisian school children in this way during the winters of 1945-1946 and 1947-1948. They found that the lowering of temperature varies according to the body area; the average temperature has fallen by 3.8 degrees C. at the level of the knees and by 2.5 degrees C. in the area of the buttocks (an area where circulation is normally already reduced). The trunk is relatively spared; on the abdomen, the temperature decreased until 1945-1946 and rose thereafter; the temperature of the buttocks appeared to be stationary after a fall in 1945-1946. The lowering of the skin temperature is considered by the author a protective process that diminishes caloric loss and consequently the need for food.

Vitamins

P. Duquenois, in his capacity of expert for the control of proprietary medicines, has had to examine a large number of products containing various vitamins. He has found that the amount of vitamin (determined by Tillmans' method for vitamin C and by biologic methods in the rat for vitamin D) agreed

nine times out of ten with the formula in samples gathered immediately after production. On the contrary, the same proprietary medicines taken at the druggist's or after having stayed some months in the laboratory did not yield the same rate. The amount of vitamins C and D diminishes with the duration of the storage: three times out of ten it was half the one advertized; in 1 case it was not possible to detect the vitamin C. It is oxidation, little to be feared when the vitamin is in the crystallized state, that interferes with conservation, especially when the humidity rate attains 10 per cent.

Inquiry on Food and Nutrition

On the initiative of the Nutrition and Food Commission of the National Academy of Medicine, A. Mayer, at one of the last meetings, gave a report on the food crisis in France. A comparison between the metropolitan prewar production and that of 1946-1947 shows serious deficits in glucides, fats and milk:

	Average Production	
	1935-1940	1946-1947
Wheat.....	80,000,000 quintals	32,000,000 quintals
Potatoes.....	150,000,000 quintals	114,000,000 quintals
Beet sugar.....	9,000,000 quintals	7,000,000 quintals
Ment.....	2,000,000 tons	1,700,000 tons
Starchy vegetables.....	2,250,000 quintals	1,700,000 quintals
Eggs.....	450,000 tons	365,000 tons
Milk.....	146,000,000 hectoliters	92,000,000 hectoliters
Animal fat.....	350,000 tons	270,000 tons

The author emphasizes the important part played by physicians in a food crisis: He has to deal with the patients' diets, to protect the most susceptible groups (children, expectant and nursing mothers, adolescents, old persons, heavy workers) and to watch over the nutritional condition of various social groups. The physician ought to become one of the most important advisers of those in charge of national and world economy.

TURKEY

ANKARA, Sept. 14, 1948.

Q Fever Investigation in Turkey

Prof. R. Parker, Director of the United States Rocky Mountain Spotted Fever Laboratory, informed the Ministry of Health in Turkey that Q fever antigen had been obtained from goats imported from Turkey. In 1947 Prof. Dr. George Blanc of the Pasteur Institute of Casablanca came to Ankara to lecture on Q fever. Thereupon Dr. Said Golem of the Ankara Central Institute of Hygiene asked Dr. Parker for antigen. Prof. Blanc sent engorged ticks of Morocco stock. Inoculating guinea pigs and injecting the infected guinea pig serum into eggs, Dr. Muhtar Derman of the control service of the institute produced the second antigen series for the serologic tests. Dr. Niyazi Musa Erzin, director of the Ankara Institute, who studied at the Robert Koch Institute in Berlin, directed the investigation. Dr. Sabaheddin Payzin, chief of the serum control laboratory, collected serums from hospitals. Dr. Said Golem searched for antibodies in human and animal serums and isolated stocks.

The first patient was Dr. Ali Korur of the Ankara Model Hospital, who in February 1947 suffered from atypical pneumonia and was treated at the hospital. The disease began with malaise, slight fever and chills, increase of fever the next day and pain in the left upper part of the chest, the pain increasing with deeper breathing. Roentgenograms revealed a pneumonia focus at the upper lobe of the left lung; two days later a second focus had developed; three days later a third, and four days later the roentgen examination clearly indicated the disappearance of the foci. The roentgenogram made after the patient

had been free from fever for several days again showed lesions. The leukocyte count on the fourth day of the disease was 9,600, on the seventh 8,300 and on the eighth day 8,000.

Every third day mice were inoculated with sputum. There were no deaths among the mice, but the sputum had revealed no pneumococcus. On the eleventh day the fever gradually came to normal. Sulfonamide and penicillin treatment had not been effective; a complement fixation test made one year later revealed a serum titer of 1/80, with a reaction of 2 plus and heated serum agglutination a titer of 1/4. This serum was sent to the United States Rocky Mountain Spotted Fever Laboratory, where the titer was found to be 1/128.

The second patient was Dr. Mahmud Sabit Akalin, formerly director of the Central Institute of Hygiene, who was treated at his home. The third was a boy aged 17 with the usual symptoms of pneumonia; radiology revealed lesions at the base of the left lung. The leukocyte count was 7,400. On the fifth day a guinea pig was inoculated with blood from the patient, but there was no rise in temperature. A complement fixation test of the patient's serum elicited a negative reaction on the fourth day, but on the eighteenth day gave a positive reaction at a titer of 1/15.

The serum of 60 animals was also tested. In 4 guinea pigs during convalescence from Q fever, the complement fixation reaction at a titer of 1/10 and 1/20 was clearly positive and in 1 guinea pig positive at a titer of 1/80; in 3 guinea pigs strongly positive at a titer of 1/40. Rickettsia agglutination was clearly positive at titers of 1/4 and 1/8. In 11 Angora goats only three complement fixation tests elicited positive reactions at titers of 1/10 and 1/20; all other tests elicited negative reactions. In 12 Angora sheep 7 complement fixation tests elicited clearly positive reactions at a titer of 1/10; in 2 the reaction was clearly positive at a titer of 1/20. In 11 Diyarbakir goats only one complement fixation test elicited a clearly positive reaction at a titer of 1/10 and 1 at a titer of 1/20. In 13 buffalo and in 10 cows all reactions were negative. Of 22 goats 5 had positive reactions. That sheep had a positive reaction at a titer of 2/10 points to the importance of carefully diagnosing pleuropneumonia in goats. Prof. G. Blanc's research in North Africa is important evidence that in goats Q fever is a dangerous disease and is transmitted from animal to man.

Of the 37 typical pneumonia serums from the Ankara Model Hospital the complement fixation reaction was positive in 5 cases; in 1 at a titer of 1/40 and in 4 at a titer of 1/20. In 32 the reaction was negative. Of the 101 atypical pneumonia serums 76 gave negative reactions; these patients had from six to fifteen days' hospital treatment. In 25 cases the complement fixation reaction was positive; of these 7 had a 1/10 titer, four 1/20, five 1/40 and nine 1/80 to 1/320. Several of the positive serums were forwarded to Dr. Lackman of the United States Rocky Mountain Laboratory for verification. One 1/80 titer serum Dr. Lackman found to have a titer of 1/120; the 1/160 titer, 1/1,028 and the 1/80 titer guinea pig serum 1/1,020. The discrepancies are probably the result of a difference in technique. As repeated serum tests during convalescence were carried out in only 3 cases, it was not possible to observe the increase of antibody in cases with negative reactions. The citrated blood of 16 patients was injected into 24 guinea pigs; though there had not been many patients who came under observation on the first to fourth day from the onset of the disease, rickettsiae were isolated by the eighth day. The blood of 6 patients from Ankara and 1 from Smyrna raised the temperature of 7 inoculated guinea pigs; necropsy of these guinea pigs revealed splenomegaly and Rickettsia burneti in the spleen preparation. The two institute stocks have passed through six guinea pigs. Relapses were observed in several of the guinea pigs when blood from the heart was used for passage.

In the Smyrna medical bulletin *Acta Medica* Dr. Lutfi Senirkent of the Smyrna Infectious Hospital has published results of his investigations concerning Q fever. Six patients from the environs of Smyrna, male and female, aged 17 to 70, had been sent to the hospital by the municipality physicians with the diagnosis of pneumonia or typhus. Several patients presented the usual symptoms of pneumonia; several had also a purpuric rash; livers were palpable and spleens large. All patients perspired freely. The crisis occurred on the ninth to fourteenth day; after that the temperature dropped gradually. All patients were given sulfonamide compounds or penicillin, but neither drug had any great effect. At the Central Institute of Hygiene the complement fixation reactions were found to be positive at titers of 1/20 and 1/40. Experiments on guinea pigs revealed Rickettsia burneti. In 5 patients symptoms of pneumonia were either absent or only slight, presenting the picture of a common infection. In the blood of 4 of these patients rickettsiae were found, but in only 1 was the complement fixation reaction positive at a titer of 1/20. The symptoms in several other cases, severe headaches, much perspiration and conjunctivitis, resembled those of typhus; all patients recovered. Investigations continue.

BRAZIL

(From Our Regular Correspondent)

SÃO PAULO, Sept. 14, 1948.

Follow-Up in Gastric Surgery

In a recent paper, Drs. Arrigo Raia and Claudio Bellio of the faculty of medicine of São Paulo reported the follow-up of 640 patients submitted to partial gastrectomy during the period 1936 to 1946. Only 273 answered letters, periodically sent to them to inquire about their condition after the operation. A number of patients were free of all symptoms in the first six months after operation; others wrote of certain symptoms which lasted from six months to five years. Analysis of these symptoms reveals that the three most distressing are recurrence of the peptic ulcer, the dumping syndrome and loss of weight. None of the patients had pernicious anemia. The authors concluded that although partial gastrectomy is not the ideal treatment for the gastroduodenal ulcer, it practically solves the problem and should be performed without fear.

Waters' Extraperitoneal Cesarean Section

After a careful analysis of obstetric cases complicated by infection, Drs. João Amorim, Fuad Ferreira and Jorge Tavares made a survey of the extraperitoneal technique and decided that Waters' method is the best both for the mother and the child in cases of infection during labor. Attention was drawn to the mortality rate when transperitoneal cesarean section was performed even though massive doses of penicillin and sulfonamide drugs were given. Forty cases were analyzed after operation in the Casa Maternal e da Infância and the difficulties and how to overcome them studied with regard to Waters' technique. These cases have been excellently grouped by the North Americans; the same indications were adopted in the Casa Maternal to determine whether to use the transperitoneal or the extraperitoneal method.

Treatment of Pemphigus Foliaceus

Dr. Mario Fonzari, assistant at the Institute of Foliaceus Pemphigus of São Paulo, has published a paper on this disease. According to his observations patients can take quinacrine in doses of 0.20 to 1 Gm. a day for several months without disturbances. The dose which gives best results varies from patient to patient, but improvement has always been obtained with doses varying from 0.40 to 0.60 Gm. a day. After months or even years of continued treatment, only a few residual lesions remained. Treatment may be interrupted after persistent

improvement has been established, but the skin lesions grow worse with interruption of therapy before a constant result is obtained. Yellow pigmentation of the skin is not a sign of intoxication but one of benefit by quinacrine. The author noticed steady improvement only in patients whose skin became intensely yellow. This pigmentation disappears in time, whether the patient goes on with the treatment or not. Patients treated and improved with quinacrine present from time to time eruptions of small boils, which are easily treated with sulfonamide drugs and penicillin. Quinacrine does not act on secondary effects and does not prevent the pain in the bones which occurs frequently in persons suffering from pemphigus and which disappear with the administration of high doses of vitamin D.

Correspondence

METHADON ADDICTION

To the Editor:—There is evidence of increasing use by drug addicts of the new synthetic drug, methadon (6-dimethylamino-4,4-diphenyl-3-heptanone, also known by the trade names "dolophine" and "adanon") to gratify drug addiction. The result of a special observation of this trend in one district—which can be considered as substantially representative of the general trend in all districts—shows that most of these addicts are obtaining their supplies of "dolophine," for example, through narcotic "prescriptions" issued by registered practitioners. While this special observation related to use of the drug under the name "dolophine," the irregularities can be considered likewise incident to the use of methadon or "adanon," which are, of course, other names for the same drug.

An investigating officer of this Bureau found that a large number of the addicts using methadon had previously confined their addiction to the use of morphine or heroin. He interviewed a number of these addicts and learned from them that methadon has the same effects on them as morphine or heroin with but two exceptions. The first exception is that on administering morphine or heroin hypodermically they experience what they describe as a tingling sensation. This "tingle" is absent in the use of methadon. The second exception is that the withdrawal symptoms experienced on the removal of methadon are not as severe as those symptoms experienced on the removal of heroin or morphine. However, the methadon withdrawal symptoms are very definite. The general over-all effect of methadon satisfies the craving of the morphine and heroin addict with the same disastrous results.

It was also found that a majority of the narcotic addicts are now requesting physicians to prescribe "dolophine" for them instead of asking the physician to prescribe morphine. The addicts claim that when they approach a physician and furnish him with fictitious symptoms of some condition which may require narcotics, if they request or suggest morphine the physician immediately classes them as narcotic addicts. Under these circumstances the physician proceeds with caution and usually refuses to prescribe for them. However, they have found that if under similar circumstances they request "dolophine" instead of morphine the physician will usually prescribe for them.

One of the methods used by the addict to obtain "dolophine" from a physician is to have the name written on a piece of paper. He then complains to the physician of the severe pain he is suffering. He tells the physician that he does not wish to take any habit-forming drug such as morphine but understands that the drug written on the paper is good for pain and is not habit forming. In any case the addict is seldom met with resistance from the physician when a treatment of "dolophine" is suggested by the addict. When these addicts are again in

a position to purchase morphine or heroin from the illegal channels they resume their use of these narcotic drugs.

The officer also discussed the subject of methadon with a number of physicians. He found that a majority of the physicians were under the impression that methadon was not habit forming and therefore they prescribed methadon more freely and in larger quantities than morphine or other opium derivatives. Although realizing that methadon is regulated under the federal narcotic laws some physicians claimed that it was not an opiate inasmuch as it is a synthetic drug and not a derivative of opium. Among the physicians in general it was found that they were not adequately informed regarding the addiction-forming qualities of methadon and in some cases were misinformed.

Certain narcotic addicts do not wish to take the risk of being brought to the attention of the narcotic officers by visiting physicians. The officer learned from various sources that this class of addict when not in a position to obtain morphine or heroin will purchase methadon from peddlers who obtain their supply on "prescriptions" or through drug store burglaries. The latter source is substantiated by the fact that methadon is almost always included in the narcotic drugs taken by burglars.

H. J. ANSLINGER,

Commissioner of Narcotics, Washington, D. C.

DIAGNOSIS OF MALIGNANCY

To the Editor:—A recent article in THE JOURNAL gives voice to a statement which is occasionally made, sometimes accepted and too often practiced; yet it should not go unchallenged lest it be assumed by others that the idea is approved by a wide circle of the author's pathologist colleagues. This letter is not a challenge to the author's main thesis on the value of heterologous tissue transplants (Greene, H. S. N.: Identification of Malignant Tissues, J. A. M. A. 137:1364-1365 [Aug. 14] 1948), but only to an introductory statement to the effect that the characterization of tissues as malignant or cancerous is based solely on morphologic considerations in most laboratories. The idea is a half truth as it stands. The diagnosis is not usually solely so based, but rather on morphologic considerations interpreted in the light of subsequent course in a large past experience with similar tumors. Such interpretation is justified in cases of the common tumors in which a large experience correlating morphology with the natural biologic behavior and life history of the tumors has been accumulated. The efficacy of the method is attested to by the high degree of skill exhibited by some of its users and the tacit confidence expressed in the results by their clinical confreres. The method occasionally falls into disrepute when it is abused by (a) failure of the user to acquire skill in the use of existing accumulated knowledge in the correlation of morphologic features with degree of malignancy or (b) use of method to estimate degree of malignancy in the case of rare or new tumors in the absence of previous specific experience. Some tumors are biologically more malignant and others less malignant than their histologic appearance suggests; yet which is which can only be known after observation of the subsequent behavior in a series of cases. Morphologic considerations cannot always be safely transferred from tumors of one type to another. A method of proved value should, however, not be judged by its misuse. The human host to tumor has, unfortunately, too often through the past years served as a biologic indicator for the degree of malignancy for many tumors the histologic morphology of which was known, so that a high degree of correlation is now possible.

PAUL E. STEINER, M.D.,

Professor of Pathology, University of Chicago.

had been free from fever for several days again showed lesions. The leukocyte count on the fourth day of the disease was 9,600, on the seventh 8,300 and on the eighth day 8,000.

Every third day mice were inoculated with sputum. There were no deaths among the mice, but the sputum had revealed no pneumococcus. On the eleventh day the fever gradually came to normal. Sulfonamide and penicillin treatment had not been effective; a complement fixation test made one year later revealed a serum titer of 1/80, with a reaction of 2 plus and heated serum agglutination a titer of 1/4. This serum was sent to the United States Rocky Mountain Spotted Fever Laboratory, where the titer was found to be 1/128.

The second patient was Dr. Mahmud Sabit Akalin, formerly director of the Central Institute of Hygiene, who was treated at his home. The third was a boy aged 17 with the usual symptoms of pneumonia; radioscopy revealed lesions at the base of the left lung. The leukocyte count was 7,400. On the fifth day a guinea pig was inoculated with blood from the patient, but there was no rise in temperature. A complement fixation test of the patient's serum elicited a negative reaction on the fourth day, but on the eighteenth day gave a positive reaction at a titer of 1/15.

The serum of 60 animals was also tested. In 4 guinea pigs during convalescence from Q fever, the complement fixation reaction at a titer of 1/10 and 1/20 was clearly positive and in 1 guinea pig positive at a titer of 1/80; in 3 guinea pigs strongly positive at a titer of 1/40. Rickettsia agglutination was clearly positive at titers of 1/4 and 1/8. In 11 Angora goats only three complement fixation tests elicited positive reactions at titers of 1/10 and 1/20; all other tests elicited negative reactions. In 12 Angora sheep 7 complement fixation tests elicited clearly positive reactions at a titer of 1/10; in 2 the reaction was clearly positive at a titer of 1/20. In 11 Diyarbakir goats only one complement fixation test elicited a clearly positive reaction at a titer of 1/10 and 1 at a titer of 1/20. In 13 buffalo and in 10 cows all reactions were negative. Of 22 goats 5 had positive reactions. That sheep had a positive reaction at a titer of 2/10 points to the importance of carefully diagnosing pleuropneumonia in goats. Prof. G. Blanc's research in North Africa is important evidence that in goats Q fever is a dangerous disease and is transmitted from animal to man.

Of the 37 typical pneumonia serums from the Ankara Model Hospital the complement fixation reaction was positive in 5 cases; in 1 at a titer of 1/40 and in 4 at a titer of 1/20. In 32 the reaction was negative. Of the 101 atypical pneumonia serums 76 gave negative reactions; these patients had from six to fifteen days' hospital treatment. In 25 cases the complement fixation reaction was positive; of these 7 had a 1/10 titer, four 1/20, five 1/40 and nine 1/80 to 1/320. Several of the positive serums were forwarded to Dr. Lackman of the United States Rocky Mountain Laboratory for verification. One 1/80 titer serum Dr. Lackman found to have a titer of 1/120; the 1/160 titer, 1/1,028 and the 1/80 titer guinea pig serum 1/1,020. The discrepancies are probably the result of a difference in technic. As repeated serum tests during convalescence were carried out in only 3 cases, it was not possible to observe the increase of antibody in cases with negative reactions. The citrated blood of 16 patients was injected into 24 guinea pigs; though there had not been many patients who came under observation on the first to fourth day from the onset of the disease, rickettsiae were isolated by the eighth day. The blood of 6 patients from Ankara and 1 from Smyrna raised the temperature of 7 inoculated guinea pigs; necropsy of these guinea pigs revealed splenomegaly and Rickettsia burneti in the spleen preparation. The two institute stocks have passed through six guinea pigs. Relapses were observed in several of the guinea pigs when blood from the heart was used for passage.

In the Smyrna medical bulletin *Acta Medica* Dr. Lutfi Senirkent of the Smyrna Infectious Hospital has published results of his investigations concerning Q fever. Six patients from the environs of Smyrna, male and female, aged 17 to 70, had been sent to the hospital by the municipality physicians with the diagnosis of pneumonia or typhus. Several patients presented the usual symptoms of pneumonia; several had also a purpuric rash; livers were palpable and spleens large. All patients perspired freely. The crisis occurred on the ninth to fourteenth day; after that the temperature dropped gradually. All patients were given sulfonamide compounds or penicillin, but neither drug had any great effect. At the Central Institute of Hygiene the complement fixation reactions were found to be positive at titers of 1/20 and 1/40. Experiments on guinea pigs revealed Rickettsia burneti. In 5 patients symptoms of pneumonia were either absent or only slight, presenting the picture of a common infection. In the blood of 4 of these patients rickettsiae were found, but in only 1 was the complement fixation reaction positive at a titer of 1/20. The symptoms in several other cases, severe headaches, much perspiration and conjunctivitis, resembled those of typhus; all patients recovered. Investigations continue.

BRAZIL

(From Our Regular Correspondent)

SÃO PAULO, Sept. 14, 1948.

Follow-Up in Gastric Surgery

In a recent paper, Drs. Arrigo Raia and Claudio Bellio of the faculty of medicine of São Paulo reported the follow-up of 640 patients submitted to partial gastrectomy during the period 1936 to 1946. Only 273 answered letters, periodically sent to them to inquire about their condition after the operation. A number of patients were free of all symptoms in the first six months after operation; others wrote of certain symptoms which lasted from six months to five years. Analysis of these symptoms reveals that the three most distressing are recurrence of the peptic ulcer, the dumping syndrome and loss of weight. None of the patients had pernicious anemia. The authors concluded that although partial gastrectomy is not the ideal treatment for the gastroduodenal ulcer, it practically solves the problem and should be performed without fear.

Waters' Extraperitoneal Cesarean Section

After a careful analysis of obstetric cases complicated by infection, Drs. João Amorim, Fuad Ferreira and Jorge Tavares made a survey of the extraperitoneal technics and decided that Waters' method is the best both for the mother and the child in cases of infection during labor. Attention was drawn to the mortality rate when transperitoneal cesarean section was performed even though massive doses of penicillin and sulfonamide drugs were given. Forty cases were analyzed after operation in the Casa Maternal e da Infância and the difficulties and how to overcome them studied with regard to Waters' technic. These cases have been excellently grouped by the North Americans; the same indications were adopted in the Casa Maternal to determine whether to use the transperitoneal or the extraperitoneal method.

Treatment of Pemphigus Foliaceus

Dr. Mario Fonzari, assistant at the Institute of Foliaceus Pemphigus of São Paulo, has published a paper on this disease. According to his observations patients can take quinacrine in doses of 0.20 to 1 Gm. a day for several months without disturbances. The dose which gives best results varies from patient to patient, but improvement has always been obtained with doses varying from 0.40 to 0.60 Gm. a day. After months or even years of continued treatment, only a few residual lesions remained. Treatment may be interrupted after persistent

improvement has been established, but the skin lesions grow worse with interruption of therapy before a constant result is obtained. Yellow pigmentation of the skin is not a sign of intoxication but one of benefit by quinacrine. The author noticed steady improvement only in patients whose skin became intensely yellow. This pigmentation disappears in time, whether the patient goes on with the treatment or not. Patients treated and improved with quinacrine present from time to time eruptions of small boils, which are easily treated with sulfonamide drugs and penicillin. Quinacrine does not act on secondary effects and does not prevent the pain in the bones which occurs frequently in persons suffering from pemphigus and which disappear with the administration of high doses of vitamin D.

Correspondence

METHADON ADDICTION

To the Editor:—There is evidence of increasing use by drug addicts of the new synthetic drug, methadon (6-dimethylamino-4,4-diphenyl-3-heptanone, also known by the trade names "dolophine" and "adanon") to gratify drug addiction. The result of a special observation of this trend in one district—which can be considered as substantially representative of the general trend in all districts—shows that most of these addicts are obtaining their supplies of "dolophine," for example, through narcotic "prescriptions" issued by registered practitioners. While this special observation related to use of the drug under the name "dolophine," the irregularities can be considered likewise incident to the use of methadon or "adanon," which are, of course, other names for the same drug.

An investigating officer of this Bureau found that a large number of the addicts using methadon had previously confined their addiction to the use of morphine or heroin. He interviewed a number of these addicts and learned from them that methadon has the same effects on them as morphine or heroin with but two exceptions. The first exception is that on administering morphine or heroin hypodermically they experience what they describe as a tingling sensation. This "tingle" is absent in the use of methadon. The second exception is that the withdrawal symptoms experienced on the removal of methadon are not as severe as those symptoms experienced on the removal of heroin or morphine. However, the methadon withdrawal symptoms are very definite. The general over-all effect of methadon satisfies the craving of the morphine and heroin addict with the same disastrous results.

It was also found that a majority of the narcotic addicts are now requesting physicians to prescribe "dolophine" for them instead of asking the physician to prescribe morphine. The addicts claim that when they approach a physician and furnish him with fictitious symptoms of some condition which may require narcotics, if they request or suggest morphine the physician immediately classes them as narcotic addicts. Under these circumstances the physician proceeds with caution and usually refuses to prescribe for them. However, they have found that if under similar circumstances they request "dolophine" instead of morphine the physician will usually prescribe for them.

One of the methods used by the addict to obtain "dolophine" from a physician is to have the name written on a piece of paper. He then complains to the physician of the severe pain he is suffering. He tells the physician that he does not wish to take any habit-forming drug such as morphine but understands that the drug written on the paper is good for pain and is not habit forming. In any case the addict is seldom met with resistance from the physician when a treatment of "dolophine" is suggested by the addict. When these addicts are again in

a position to purchase morphine or heroin from the illegal channels they resume their use of these narcotic drugs.

The officer also discussed the subject of methadon with a number of physicians. He found that a majority of the physicians were under the impression that methadon was not habit forming and therefore they prescribed methadon more freely and in larger quantities than morphine or other opium derivatives. Although realizing that methadon is regulated under the federal narcotic laws some physicians claimed that it was not an opiate inasmuch as it is a synthetic drug and not a derivative of opium. Among the physicians in general it was found that they were not adequately informed regarding the addiction-forming qualities of methadon and in some cases were misinformed.

Certain narcotic addicts do not wish to take the risk of being brought to the attention of the narcotic officers by visiting physicians. The officer learned from various sources that this class of addict when not in a position to obtain morphine or heroin will purchase methadon from peddlers who obtain their supply on "prescriptions" or through drug store burglaries. The latter source is substantiated by the fact that methadon is almost always included in the narcotic drugs taken by burglars.

Commissioner of Narcotics, Washington, D. C.

DIAGNOSIS OF MALIGNANCY

To the Editor:—A recent article in THE JOURNAL gives voice to a statement which is occasionally made, sometimes accepted and too often practiced; yet it should not go unchallenged lest it be assumed by others that the idea is approved by a wide circle of the author's pathologist colleagues. This letter is not a challenge to the author's main thesis on the value of heterologous tissue transplants (Greene, H. S. N.: Identification of Malignant Tissues, J. A. M. A. **137**:1364-1365 [Aug. 14] 1948), but only to an introductory statement to the effect that the characterization of tissues as malignant or cancerous is based solely on morphologic considerations in most laboratories. The idea is a half truth as it stands. The diagnosis is not usually solely so based, but rather on morphologic considerations interpreted in the light of subsequent course in a large past experience with similar tumors. Such interpretation is justified in cases of the common tumors in which a large experience correlating morphology with the natural biologic behavior and life history of the tumors has been accumulated. The efficacy of the method is attested to by the high degree of skill exhibited by some of its users and the tacit confidence expressed in the results by their clinical confreres. The method occasionally falls into disrepute when it is abused by (a) failure of the user to acquire skill in the use of existing accumulated knowledge in the correlation of morphologic features with degree of malignancy or (b) use of method to estimate degree of malignancy in the case of rare or new tumors in the absence of previous specific experience. Some tumors are biologically more malignant and others less malignant than their histologic appearance suggests; yet which is which can only be known after observation of the subsequent behavior in a series of cases. Morphologic considerations cannot always be safely transferred from tumors of one type to another. A method of proved value should, however, not be judged by its misuse. The human host to tumor has, unfortunately, too often through the past years served as a biologic indicator for the degree of malignancy for many tumors the histologic morphology of which was known, so that a high degree of correlation is now possible.

Professor of Pathology, University of Chicago.

Medical Economics

THE COST AND QUANTITY OF MEDICAL CARE IN THE UNITED STATES

NOTE.—Summary of a monograph of the same title, "The Cost and Quantity of Medical Care in the United States," by Frank G. Dickinson, Ph.D., Director of the Bureau of Medical Economic Research of the American Medical Association. The 20 page monograph has just been published as Bureau Bulletin Number 66.—Ed.

In September 1947, the Bureau of Medical Economic Research published an analysis of consumer expenditures for medical care for 1929-1946 under the title "Is Medical Care Expensive?"¹ The Department of Commerce has recently released consumer expenditure estimates for 1947 along with a revision of its previously published data for 1944-1946.² In addition to discussing these new and revised data, Dr. Dickinson has expanded the scope of the Bureau's study to include an analysis of changes in the quantity of medical care received by the American people. In Bulletin 66 he combines the index of consumer expenditures with the Department of Labor price index previously discussed³ in order to develop an index of the quantity of medical care for 1940-1947.

Before discussing three aspects of medical care—expenditures, price and quantity—the bulletin compares the original and the revised Department of Commerce estimates for 1944, 1945 and 1946. The earlier estimates of total consumer expenditures were increased by 0.9 per cent for 1944, 0.9 per cent for 1945 and 2.6 per cent for 1946; corresponding increases in medical care expenditure estimates were 2.8 per cent, 3.8 per cent and 4.9 per cent. Of the total upward revision of \$984 million for 1944, \$134 million, or 14 per cent, was distributed among medical care items. Approximately 16 per cent and 7 per cent of the increases for 1945 and 1946 were allocated to medical care. "In view of the fact that medical care generally accounts for about one twenty-fifth (4 per cent) of total consumer expenditures, the allocation of one fourteenth to one seventh of the increases to medical care is, to say the least, surprising."

Unfortunately, the revised data for 1944-1946 were published without any explanation of this disproportionate increase in the medical care estimates. In support of the revised data, well informed members of the staffs of the American Hospital Association and the American Dental Association consider the upward revisions for hospitals and dentists' services (which were substantially greater than the revisions for physicians' services) to be more nearly accurate than the earlier estimates. Despite this fact, Dr. Dickinson raises a question as to whether these new and revised data are consistent with the consumer expenditure series for 1929-1943. Pending some explanation by the Department of Commerce, he therefore analyzes the 1944-1947 consumer expenditure data with as little reference as possible to previously published expenditure data.

EXPENDITURES

The Department of Commerce data show that consumer expenditures for medical care rose from \$4.9 billion in 1944 to \$6.5 billion in 1947, or 34 per cent, while total consumer expenditures rose from \$111.4 billion to \$164.8 billion, or 48 per cent. Expressed as a percentage of total consumer expenditures, the amount spent for all medical care items declined from 4.4 per cent in 1944 to 4.0 per cent in 1947. Within the medical care field, consumer expenditures for physicians' services rose from \$1.3 billion in 1944 to \$1.7 billion in 1947, or 24 per cent, while expenditures for hospitals rose 67 per cent, for drugs 26 per cent, for dentists' services 28 per cent and for all other medical care items combined 32 per cent. The percentage of total consumer expenditures for physicians' services declined from 1.2 in 1944 to 1.0 in 1947, while the percentage for hospitals rose from 0.7 to 0.8. Dr. Dickinson observes that

these changes over the past four years are conditioned by the fact that 1944 was a year when 40 per cent of physicians were in the armed forces and the normal pattern of consumer expenditures was distorted by wartime shortages and rationing. Summarizing the data for 1944-1947, he notes that expenditures for medical care have increased, but less rapidly than total consumer expenditures. The percentage of the American family budget spent for medical care, particularly for physicians' services, has declined. The physicians' share of the medical care dollar has decreased from 27.4 cents in 1944 to 25.5 cents in 1947; meanwhile the hospitals' share has risen from 16.4 cents to 20.5 cents. "One might say that medical care has become increasingly expensive in the past four years but that, relative to the other items which make up the average consumer's budget, the cost of medical care has declined (in particular, the physicians' share of that cost)."

As in the previous study, the new bulletin presents an extensive comparison of medical care expenditures with expenditures for alcoholic beverages, recreation, tobacco, personal care and jewelry. These five items were selected because they are comparable to medical care or its subcategories in magnitude of expenditure and because, like medical care, they are generally purchased or used irregularly. In order to provide a broader basis for comparison, the bulletin includes expenditure data for six additional items—owner-occupied nonfarm dwellings, shoes, furniture, fuel except gas and ice, household utilities and user-operated transportation. The analysis of expenditures for these selected items reveals that Americans spend almost 50 per cent more for both alcoholic beverages and recreation than for all medical care items combined; physicians' services account for one-half as much of the average budget as tobacco and somewhat less than personal care, and consumers spend less for hospitals than for jewelry.

In the light of these consumer expenditure data, Dr. Dickinson challenges the oft-repeated statement that Americans cannot afford good medical care. Since the average family spends only 4 per cent of its budget for medical care, the statement could apply only to those relatively few families with disproportionately heavy medical expenses in a given year. To a great and increasing extent these families are now offered a choice between "bludgeon and budget" by the various prepayment medical care and hospitalization insurance plans now widely available. Although personal savings are still necessary to help meet catastrophic and minor medical costs, these prepayment plans "give most families the chance to become average (or 4 per cent) families with regard to the budget for medical care."

PRICES

The Consumers' Price Index, the medical care portion of which is presented in the bulletin, covers only the prices paid by moderate income families in thirty-four large cities. Despite this limitation, the index is generally considered to be representative of the entire nation, as shown by its use in wage negotiations for the purpose of gearing wages to changes in the cost of living. Between the base period 1935-1939 and 1947, the over-all price index rose 59.2 per cent while the index of medical care prices rose only 31.6 per cent. Thus the cost of living has increased almost twice as much in the past decade as the cost of medical care. The price data for the individual items of medical care show that only the index for hospital room rates (179.6) stood above the Consumers' Price Index in 1947; this fact is explained by the increased cost of labor, food and other items necessary to operate a hospital.

QUANTITY

By dividing the index of consumer expenditures for medical care items by the price index for those same items, Dr. Dickinson has derived an index of the quantity of medical care. This statistical procedure is called "deflation of the dollar series" and is based on the fact that consumer expenditures for a given item are equal to the product of the price of that item and the total quantity purchased. The reader is cautioned that the indexes of quantity presented in the bulletin are realistic only in so far as the price indexes used in the deflation procedure cover exactly the same group of items as the indexes of consumer expenditures and weight these items according to the relative amounts purchased in some satisfactory base year.

1. Is Medical Care Expensive? Bulletin 60, American Medical Association, Bureau of Medical Economic Research, September 1947.

2. Survey of Current Business, United States Department of Commerce, July 1948.

3. Comparative Increases in the Costs of Medical Care and in the Costs of Living, Bulletin 62, American Medical Association, Bureau of Medical Economic Research, May 1948.

The results of the deflation procedure indicate that the quantity of all medical care items combined has increased 90 per cent in the past decade while the quantity of physicians' services has increased 60 per cent, hospitals 70 per cent, dentists' services 90 per cent and drugs 110 per cent. Several reasons are cited for believing that these derived indexes of quantity actually overstate increases in the volume of medical care during the past ten years. For example, the larger percentage of bills collected by physicians is reflected in the derived index as an increase in the quantity of physicians' services. Despite this and other limitations of the data, the conclusions reached in the bulletin are that the quantity of medical care received by the American people has been increasing rapidly in the past decade and that the quantity of physicians' services has increased considerably faster than the number of physicians. These increases in output per physician probably match similar increases in output per man hour in our great factories. These conclusions are not surprising in view of the fact that technologic improvements in medicine enable the physician to care for many more patients today than he could ten years ago. "The typical physician is now assisted by nurses, technicians, and 'wonder drugs'; diagnosis and treatment have become a matter of teamwork."

As Dr. Dickinson observes, increases in the quantity of medical care during the past decade have been accompanied by improvements in quality. "The difference between 1929 medical care and 1947 medical care probably equals or exceeds the difference between a 1929 automobile and a 1947 automobile." The benefits of these quantitative and qualitative changes in medical care are being received by the consumer in the form of better health and longer life. But no amount of improvement in medical care will satisfy the demand "as long as pain comes too often and death too soon. Members of the medical care team have an unlimited opportunity to improve medical care and at the same time are exposed to the hazard of attaining one goal only to find that the goal has been moved up. The demand for improved medical care is well-nigh insatiable, and those who try to provide it are subject to easy criticism."

Medical Motion Pictures

NEW MOTION PICTURES ADDED TO THE A. M. A. LIBRARY

The following 16 mm. motion pictures are available on a loan basis to physicians through the Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn Street, Chicago 10.

Human Growth. Color, sound, 750 feet (1 reel), showing time nineteen minutes. Produced by Eddie Albert Productions, Hollywood, for the University of Oregon.

This motion picture is based on adolescence and presents the biologic facts of sex as a part of human growth and development, demonstrating to parents how sex education can be handled smoothly, intelligently and in a socially acceptable manner in schools. It is designed primarily for the sixth through the eighth grade level.

Human Reproduction. Black and white, sound, 825 feet (1 reel), showing time twenty-three minutes. Prepared by Harold S. Diehl, M.D., University of Minnesota, Minneapolis, for correlation with the "Textbook of Healthful Living."

The anatomy and physiology of the human reproductive system with explanation of ovulation and menstruation are depicted in this film. This production is suitable for college groups, selected high school groups, nurses, teachers and parents. (Reviewed in THE JOURNAL, May 15, 1948, p. 323.)

A Life in Your Hands. Black and white, sound, showing time nine minutes. Produced by The March of Time Forum for the American National Red Cross.

The film describes the new National Blood Program and portrays why this program is so urgent at this time.

Physicians called on to address lay audiences, such as Service Organizations and Parent-Teachers' Association, may find these films a useful adjunct in their lectures.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Osteopathic Practice Acts: Right of Osteopath to Prescribe Drugs or Medicine.—The defendant, a licensed osteopath, was prosecuted under an indictment charging that he practiced medicine by administering and prescribing drugs in treating the ailments of others without being licensed and registered so to do. From a finding of guilty in the trial court the defendant appealed to the Supreme Court of North Carolina.

The evidence showed that the accused engaged in the practice of the healing art for compensation. By means of a printed professional card he represented himself to be a "physician and surgeon." He examined his patients, diagnosed their ailments and determined the remedies to be applied. He administered ultraviolet rays to those suffering from cutaneous diseases and relied on hypodermic injections of alcohol and "liver extracts" for the alleviation of certain other ailments. On at least two occasions, he gave a patient afflicted with low blood pressure injections of a liquid which he represented to be a "heart stimulant." On numerous occasions, the accused directed his patients to procure from druggists and to use either internally or externally in the treatment of their ailments various patent or proprietary preparations possessing or reputed to possess curative or remedial properties. He said that he "couldn't write prescriptions" and did not issue any written prescriptions covering any of these substances, but he gave oral orders therefor to the druggists, and the druggists delivered the preparations to his patients in bottles or other containers bearing statements of his directions with respect to their mode of administration. A few of these patent or proprietary remedies were laxatives or tonics.

The defendant held a certificate from the North Carolina State Board of Osteopathic Examination and Registration entitling him to practice osteopathy, but he had never received a license to practice medicine and surgery from the North Carolina State Board of Medical Examiners and had never registered as a physician or surgeon with the clerk of the superior court of Richmond County. This appeal, said the Supreme Court, presents this fundamental question: Is an osteopathic physician duly licensed by the North Carolina State Board of Osteopathic Examination and Registration entitled under the law to administer or prescribe drugs in treating the ailments of his patients?

Licenses to practice medicine and surgery, said the Supreme Court, are granted by the State Board of Medical Examiners under article 1 of chapter 90 of the General Statutes and certificates to practice osteopathy are issued by the State Board of Osteopathic Examination and Registration under article 7 of chapter 90 of the General Statutes. An inspection of these statutes makes it evident that the legislature regards the practice of medicine and surgery as one thing and the practice of osteopathy as another. The legislature enacted statutes requiring applicants for licenses to practice medicine and surgery to attend medical schools, to take courses calculated to equip them to administer and prescribe drugs and use surgical instruments and to undergo examination as to proficiency to practice medicine and surgery by a licensing board composed of regularly graduated physicians appointed by the North Carolina Medical Society. In like manner the legislature decreed that applicants for certificates to practice osteopathy should attend colleges of osteopathy, pursue studies designed to qualify them to treat diseases without the use of drugs and undergo examination as to competency to practice osteopathy by a licensing board composed of practitioners of osteopathy appointed by the governor on the recommendation of the North Carolina Osteopathic Society. It is significant that the legislature specifies that applicants for licenses to practice medicine and surgery shall study the subjects of materia medica and therapeutics but makes no such requirement with respect to applicants for certificates to practice osteopathy. It is also significant that a licensed

osteopath is designated as an osteopathic physician by the legislature.

There is no lack of clarity in the meaning of "osteopathy" either in language or in law, the Supreme Court continued. It is the very antithesis of any science of medicine involving the use of drugs. In fact, said the court, a prior decision in North Carolina recognized that osteopathy is a "mode of treatment which absolutely excludes medicines and surgery from its pathology." The defendant contended, however, that the medical practice act imposed on the state the burden of showing beyond a reasonable doubt "that the action or practice with which the defendant, a duly licensed osteopathic physician, is charged was not taught in the recognized colleges of osteopathy." This contention, replied the Supreme Court, is interesting but not convincing. The statutes clearly contemplate that osteopathic physicians shall diagnose and treat diseases by employing osteopathy. The words "as taught by the various colleges of osteopathy recognized by the North Carolina Osteopathic Society" do not therefore set at large the signification of "osteopathy," permitting the colleges to give it any meaning they choose. The thing to be taught is osteopathy—"the science of healing without the use of drugs." The legislature merely authorizes the colleges to determine, select and teach the most desirable methods of doing what is comprehended within the term "osteopathy." The colleges, concluded the Supreme Court, cannot change the law of North Carolina or widen the scope of the osteopath's certificate so as to permit him to practice other systems of healing by the simple expedient of varying their curriculums. The conclusion is inescapable that the legislature has denied to licensed osteopaths the privilege of using drugs in their practice.

The defendant next contended that the testimony of the prosecution did not indicate that any of the substances mentioned in the evidence constituted drugs in a legal sense. He argued that no substance is a drug within the meaning of the laws governing the practice of osteopathy unless it is compounded pursuant to some individual formula, unless it is poisonous or unless it is habit forming in nature. We hold, said the Supreme Court, that in so far as the practice of osteopathy is concerned a "drug" is any substance used as a medicine or in composition of medicines for internal or external use, and a "medicine" is any substance or preparation used in treating disease. Hence, the term "drugs" embraces patent or proprietary remedies possessing or reputed to possess curative or remedial properties sold and used for medicines. This is true whether or not such remedies contain poisonous ingredients, whether or not they may be purchased without any direction from a physician or whether or not they can be obtained at retail stores generally.

The defendant then argued, however, that the evidence did not indicate that he had administered or prescribed any of the substances in question in treating the ailments of his patients. The evidence showed that he had given hypodermic injections of various substances to his patients in treating their ailments, said the court, and this was sufficient. A person administers drugs when he gives or applies drugs to a patient.

Finally, the defendant argued that it must be ruled as a matter of law that he did not prescribe drugs because he did not issue any written prescriptions. We are unwilling, said the Supreme Court, to hold that the law permits an osteopath to do by word of mouth what it forbids him to do with pen or pencil. The giving of any direction to a patient for the use or application by him of any drugs for the cure of any bodily disease is prescribing drugs. It is undoubtedly true that "the defendant cannot be convicted in this case for doing as an osteopathic physician what he would have a perfect legal right to do as a private citizen" and that a private citizen can suggest to friends the advisability of taking some medicine without running afoul of the law. But the evidence in this case does not intimate that the accused confined himself to recommending the use of some remedy to some acquaintances. It tends to show that he held himself out as an expert in medical affairs and in determining the proper remedies for ailments diagnosed by himself on the examination of his patients, that he gave oral directions through the medium of druggists to his patients with

respect to the mode of administering medicines which he told them to take for their ailments and that he charged his patients fees for so doing. Manifestly, this testimony was sufficient.

Accordingly the Supreme Court held that an osteopath is not entitled to administer drugs in the course of his practice and that the facts of the present case were sufficient to show that the defendant did administer drugs without having a license to practice medicine. The judgment of conviction was accordingly affirmed. *State v. Baker*, 48 S. E. (2d) 61 (N. C., 1948).

Malpractice: Liability of United States for Negligence of Army Surgeon.—The plaintiff filed an action under the federal Tort Claims Act against the United States for damages alleged to have been caused by an Army surgeon negligently leaving a towel in the plaintiff's abdomen in an operation for gallbladder trouble. The case was heard in the district court of the United States, district D, Maryland.

A previous report of this case (74 F. Supp. 209; J. A. M. A. 137:904 [July 3] 1948) involved a motion by the United States to dismiss this action on the ground that the federal Tort Claims Act did not apply. The motion was overruled without prejudice and the case proceeded to trial, at which it was found that a towel had in fact been negligently left in the plaintiff's abdomen or stomach by an agent or employee of the United States. The question then again arose as to whether or not the complaint should be dismissed. The federal Tort Claims Act permits suits against the United States for money damages.

The question of primary importance, said the court, is whether the federal Tort Claims Act covers the case, that is, does it apply to a suit by an enlisted soldier in the Army of the United States injured by the alleged negligence of an Army officer as a surgeon who performed the operation on the plaintiff or by his assistants in the operation who were employees in the United States Army. The problem of statutory construction now presented, the court continued, is whether the comprehensive phrase "any claim against the United States, for money only," without words of limitation as to classes of persons who may make the claim, should be narrowed by construction to exclude claims made by members of the armed forces of the United States for service-connected injuries sustained while in such service, in view of the special relationship long existing between the United States and members of its military forces and the large body of federal legislation on the subject. We reach the conclusion that the implied exception does exist in this case.

It is not unusual in statutory construction, the court went on, to limit a general phrase by other provisions appearing in the act as a whole. The situation here is different, however, in that the implied exception comes not from other wording of the act itself but from long-existing other legislation without cross reference from one to the other. Continuing, the court said that it is clear enough that the main purpose of the act was to waive the sovereign immunity of the United States with respect to the ordinary run of tort claims arising in the United States. But so far as I am aware, private bills for the benefit of soldiers for damages resulting from service-connected injuries were at least not common, in view of the long-established provisions for the armed forces, including the Veterans Administration established during or shortly after the first World War. What Congress must have specially had in mind, said the court, was the ordinary run of tort claims affecting ordinary citizens or others arising from time to time. Injuries sustained by members of the armed forces of the United States during their service could not be within the general scope of the kinds of actions to which the committee report on the federal Tort Claims Act was referring when it used the expression "common law tort," because it is clear enough that such injuries did not constitute common law or statutory torts under the laws of the several states. Again, said the court, it may be noted that section 410 (a) of the act also provides, with respect to the test of liability, as follows: "Subject to the provisions of this title, the United States shall be liable in respect of such claims, to the same claimants, in the same manner, and to the same extent, as a private individual under like circumstances." This phraseology is seemingly inapt if it had been the intention of Congress to give soldiers additional redress for service-connected dis-

abilities. It is hardly conceivable, the court concluded, to analogize the liability of the United States to that of a private individual in respect to service-connected disabilities in view of the government-soldier particular relationship.

After considering the case from seemingly every possible angle the court was of the opinion that the federal Tort Claims Act did not apply to this case where an ex-serviceman sued for damages for malpractice by a surgeon of the United States Army. The plaintiff's case was accordingly dismissed. *Jefferson v. United States*, 77 F. Supp. 706 (Md., 1948).

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I & II*. Various Centers, Feb., June, and Sept., 1949. *Part II*, April, 1949. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2, Pa. *Part III*, Boston & New York, Nov. 9-11, Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF INTERNAL MEDICINE: *Written*, Oct. 17, 1949. Final date for filing application is May 1. *Oral*, Philadelphia, Nov. 3-5, 1948; San Francisco, date not set. Candidates now eligible for the orals cannot be promoted a place in 1949. Sec., Dr. W. A. Werrell, 1 W. Main St., Madison 3, Wisc.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*, Chicago, June 1949. Final date for filing application is Jan. 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNCOLOGY: *Part I*. Various Centers, Feb. 4, 1949. Final date for filing application is Nov. 1. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh 1.

AMERICAN BOARD OF OPHTHALMOLOGY: *Written*, Jan. 14 *Oral*, San Francisco, March 21-24; New York, June 11-15; St. Louis, Oct. 15-19; Boston, Dec. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPEDIC SURGERY: *Part I*. Various Centers, April & May. Final date for filing application is Dec. 31. Sec., Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14.

AMERICAN BOARD OF OTOLARYNGOLOGY: New York, Spring, 1949. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PEDIATRICS: *Oral*, Atlantic City, Nov. 17-19. Sec., Dr. Lee E. Hill, 718 Royal Union Bldg., Des Moines, Iowa.

AMERICAN BOARD OF PHYSICAL MEDICINE: Atlantic City, June 4-5. Final date for filing application is March 15. Sec., Dr. R. L. Bennett, Georgia Warm Springs Foundation, Warm Springs, Ga.

AMERICAN BOARD OF PLASTIC SURGERY: Examinations are given in June and November of each year in the home town of applicants. Sec., Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF SURGERY: *Written*. Various Centers, March 1949. Final date for filing application is Dec. 1. Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: Feb. 1950. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination*, Montgomery, June 28-30, 1949. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

ARKANSAS: * Little Rock, Nov. 4-5. Sec., Medical Board of the Arkansas Medical Society, Dr. L. J. Kosminsky, Texarkana. *Eclectic Examination*, Little Rock, Nov. 4. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

CALIFORNIA: *Oral*, Los Angeles, Nov. 20-21. Sec., Dr. Frederick N. Scatena, 1020 N Street, Sacramento 14.

COLORADO: * Denver, Jan. 4-7. Final date for filing application is Dec. 18. Sec.-Treas., Dr. W. W. King, 831 Republic Bldg., Denver 2.

CONNECTICUT: * *Examination*, Hartford, Nov. 9-10. Sec., Dr. Creighton Barker, 258 Church St., New Haven. *Homeopathic Examination*, Derby, Nov. 9-10. Sec., Dr. J. H. Evans, 1488 Chapel St., New Haven.

DELAWARE: *Examination*, Dover, Jan. 11-13. *Endorsement*, Jan. 20. Sec., Dr. J. S. McDaniel, 229 S. State St., Dover.

FLORIDA: * *Examination*, Jacksonville, Nov. 28-30. Sec., Dr. Frank D. Gray, 12 N. Rosalind Ave., Orlando.

GUAM: *Endorsement*, Agana, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam, % F.P.O. San Francisco, Calif.

HAWAII: *Examination*, Honolulu, Jan. 10-13. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu 53.

IDAHO: Boise, Jan. 10-12. Dir., Bureau of Occupational Licenses, Miss Estella S. Mulliner, State House, Boise.

INDIANA: *Examination*, Indianapolis, June 1949. Sec., Board of Medical Registration & Examination, Dr. Paul R. Tindall, 416 K. of P. Bldg., Indianapolis.

IOWA: * *Examination*, Des Moines, Dec. 6-8. *Endorsement*, Des Moines, Dec. 6. Sec., Dr. M. A. Royal, 506 Fleming Bldg., Des Moines.

KANSAS: Topeka, Dec. 15-16. Sec., Board of Medical Registration & Examination, Dr. J. F. Hassig, 903 N. 7th St., Kansas City.

KENTUCKY: *Examination*, Louisville, Dec. 13-15. Sec., Dr. Bruce Underwood, 620 S. 3rd St., Louisville 2.

LOUISIANA: *Examination*, New Orleans, Dec. Sec.-Treas., Dr. R. B. Harrison, 1507 Ithieria Bank Bldg., New Orleans 12. *Homeopathic Examination*, Baton Rouge, subject to call, Sec., Dr. F. H. Hardenstein, 715 Pete Marquette Bldg., New Orleans.

MAINE: Portland, Nov. 9-10. Sec., Board of Registration of Medicine, Dr. Adam P. Leighton, 192 State St., Portland.

MARYLAND: *Examination*, Baltimore, Dec. 14-17. *Endorsement*, At the discretion of the Board. Sec., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore. *Homeopathic Examination*, Baltimore, Dec. 7-8. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.

MASSACHUSETTS: *Examination*, Boston, Nov. 16-19. Sec., Board of Registration in Medicine, Dr. G. L. Schadt, 413 E. State House, Boston.

MISSISSIPPI: *Reciprocity*, Jackson, Dec. 6. Exec. Officer, State Board of Health, Dr. Felix J. Underwood, Jackson.

MISSOURI: St. Louis, Oct. 25-27. Exec. Sec., Mr. John A. Hailey, P.O. Box 4, Jefferson City, Mo.

NEBRASKA: * *Examination*, Omaha, June. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Building, Lincoln 9.

NEVADA: Carson City, Nov. 1. Sec., Dr. G. H. Ross, Industrial Bldg., Carson City.

NEW HAMPSHIRE: Concord, March 10. Sec., Board of Registration in Medicine, Dr. John S. Wheeler, 107 State House, Concord.

NEW YORK: *Examination*, Various Centers, Feb. 1-4. Sec., Dr. J. L. Lochner, Jr., 23 S. Pearl St., Education Bldg., Albany.

NORTH CAROLINA: *Endorsement*, Wilson, Oct. 25. Sec., Dr. Ivan M. Procter, 226 Hillsboro St., Raleigh.

NORTH DAKOTA: *Examination*, Grand Forks, Jan. 4-7. Act. Sec., Dr. C. J. Gaspel, Grafton.

OHIO: *Examination*, Columbus, Dec. 13-15. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: * *Reciprocity*, Oklahoma City, Oct. 24-25. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

PENNSYLVANIA: *Examination*, Philadelphia, Jan., 1949. Act. Sec., Mrs. M. G. Steiner, 351 Education Bldg., Harrisburg.

SOUTH CAROLINA: *Endorsement*, Dec. 6. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA: * Pierre, Jan. 18-19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

TEXAS: Fort Worth, Nov. 4-6. Sec.-Treas., Dr. M. H. Crabb, Medical Arts Bldg., Fort Worth.

UTAH: *Examination*, Salt Lake City, July. Sec., Dept. of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

VERMONT: *Examination*, Burlington, Feb. Sec., Dr. F. J. Lawliss, Richford.

VIRGIN ISLANDS: *Examination*, Charlotte Amalie, Dec. 8-9. Comm., Dr. Christian R. Moorhead, Charlotte Amalie.

VIRGINIA: *Examination*, Richmond, Dec. 3-4. *Endorsement*, Dec. 2. Sec., Dr. K. D. Graves, 30½ Franklin Road, Roanoke.

WASHINGTON: * Seattle, Jan. Sec., Dept. of Licenses, Miss Virginia Witherspoon, Olympia.

WISCONSIN: * Madison, Jan. 11-13, 1949. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls, Wisc.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ARIZONA: *Examination*, Tucson, Dec. 21. Sec., Mr. Francis A. Roy, University of Arizona, Tucson.

COLORADO: *Examination*, Denver, Dec. 1-2. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver 3.

FLORIDA: *Examination*, Gainesville, Nov. 6. Final date for filing application is Oct. 25. Mr. M. W. Emmel, University of Florida, Gainesville.

MICHIGAN: *Examination*, Ann Arbor & Detroit, Jan. 14-15. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.

MINNESOTA: *Examination*, Jan., April, June and Oct. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

NEW MEXICO: *Examination*, Santa Fe, Nov. 7. Sec., Miss Marguerite Kilkenny, 110 W. Houghton St., Santa Fe.

OKLAHOMA: Spring of 1949. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

OREGON: *Examination*, Portland, Dec. Sec., Basic Science Examining Committee, Dr. C. D. Byrne, Univ. of Oregon, Eugene.

SOUTH DAKOTA: *Examination*, Vermillion, Dec. 3-4. Sec., Dr. G. M. Evans, Yankton.

TENNESSEE: *Examination*, Memphis, Dec. 30-31. Sec., Dr. O. W. Hyman, 874 Union Avenue, Memphis 3.

WASHINGTON: Seattle, Jan. Sec., Dept. of Licenses, Miss Virginia Witherspoon, Olympia.

WISCONSIN: *Examination*, Milwaukee, Dec. 4. Final date for filing application is Nov. 27. Sec., Prof. W. H. Barber, Scott & Watson Sts., Ripon.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Diseases of Children, Chicago 75:135-264 (Feb.) 1948

Lye Poisoning in Children. G. W. Kernodle, G. Taylor and W. C. Davison.—p. 135.

*Infantile Form of Pernicious (Addisonian) Anemia: Report of Long Term Study of Case. B. Benjamin.—p. 143.

*Delayed Onset of "Three Months' Colic in Premature Infants. P. P. Pierce.—p. 190.

*Control of Air-Borne Infections in Nursery for Young Infants. I. Rosenstern.—p. 193.

Botulism in New Mexico: Incidence Over Ten Years, with Report of 6 Cases. M. K. Wylder.—p. 203.

Infantile Form of Pernicious Anemia.—Benjamin points out that instead of a gradual loss of gastric intrinsic factor through degenerative disease there might be a congenital absence of this factor, with a resultant infantile form of pernicious anemia. He reports the case of an infant girl, the second of 2 siblings to fall ill with what appeared to be the same malady. Her symptoms began at the age of 12 months and slowly progressed to the point where she manifested the usual clinical and laboratory signs of pernicious anemia. Her response to liver therapy and the relapsing character of the illness in the absence of such therapy were closely observed over many years, and the accumulated data have been analyzed from a number of standpoints. The syndrome which is thought to be due to congenital absence of the intrinsic factor in the gastric secretions is characterized by an initial period of normal development, during which the infant utilizes the blood-building materials accumulated in its tissues during gestation by placental transmission. After several months there becomes evident a slowly progressive fall of erythrocytes and the development of a typical picture of pernicious anemia. The condition did not exhibit the tendency to spontaneous remissions which is characteristic of pernicious (addisonian) anemia in the adult.

Three Months' Colic in Premature Infants.—According to Pierce, so-called three months' colic, which is manifested by severe, prolonged, paroxysmal crying in infants during the early weeks after birth, is a well recognized problem. This type of behavior is seldom manifest in nurseries for newborn infants. Full term infants frequently begin to cry more when they are 2 to 3 weeks old. Recently the authors have observed paroxysmal crying in a number of premature infants. In these infants the onset was usually delayed by an interval commensurate with the period of prematurity. While an adequate explanation for this behavior is not available, it is believed that these observations lend further evidence to support the hypothesis that the onset and duration of this condition are determined, at least in part, by developmental factors.

Control of Air-Borne Infections in Nursery.—Rosenstern says that because of an epidemic of enteritis at The Cradle in 1927, during which 27 deaths occurred among 80 infants, an individual aseptic nursery technic was introduced by which hand-borne cross infections have been eliminated. For the prevention of air-borne cross infections, air conditioning, germicidal lights, mechanical barriers and face masks have been in use at The Cradle. Air conditioning alone did not prevent the spread of cross infections of the respiratory tract. Germicidal irradiation of the upper air and air conditioning reduced the number of cross infections of the respiratory tract. Germicidal light barriers and air conditioning were efficient, as were also mechanical barriers. The flannel and gauze mask worn by all attendants seemed to be of value in preventing transmission of infections of the respiratory tract from nurse to infant.

American Journal of Clinical Pathology, Baltimore 18:451-522 (June) 1948

Quantitative Estimation of Barbiturates in Blood by Ultra-Violet Spectrophotometry. J. T. Walker, R. S. Fisher and J. J. McHugh.—p. 451.
Quantitative Estimation of Barbiturates in Blood by Ultra-Violet Spectrophotometry. R. S. Fisher, J. T. Walker and C. W. Plummer.—p. 462.
Effect of Insulin on Blood Picture. E. E. Baird and K. P. Dixon.—p. 470.

Consideration of Use of Blood and Oxygen as Supportive Therapy in Treatment of Malaria. R. H. Ridgion.—p. 485.

*Clinical Evaluation of Hyaluronidase in Human Infertility. R. Kurzrok.—p. 491.

Agglutination Response Following Intracutaneous Skin Testing with Brucella Abortus Antigen. N. W. Elton.—p. 499.

Variations in Brucella Agglutination Reactions in Different Laboratories. J. F. Griggs and L. W. Case.—p. 506.

Isolation of Shigella from the Gallbladder in Bacillary Dysentery. A. van der Sar, A. W. Pot and P. H. Hartz.—p. 509.

Hyaluronidase in Human Infertility.—According to Kurzrok previous studies have led to the development of a simple test for hyaluronidase in human semen, which in turn has demonstrated that the hyaluronidase content increases with the sperm concentration up to 100,000,000 sperms per cubic centimeter. Specimens of semen with excellent concentrations of sperm may not contain any hyaluronidase. The author considers such specimens infertile. The hyaluronidase content of semen does not appear to be related to the morphology, motility or "percentage" of motility of sperms. Hyaluronidase was utilized clinically in the treatment of sterility. On the day prior to ovulation the cervix is exposed by a speculum and the excess mucus over the external os is wiped off. A thin sterile cotton applicator is then gently inserted into the cervical mucus of the external os. The applicator will then have adherent to it minute strands of cervical mucus. Ten to 20 mg. of hyaluronidase is placed on the watch glass. The applicator is rolled in the enzyme on the watch glass and is then reinserted into the external os. By gentle rotation of the applicator the adherent enzyme will remain in the mucus of the cervical canal. The entire maneuver may be repeated until all the enzyme on the watch glass has been transferred into the cervix. This method is not entirely adequate. Hyaluronidase was found to be of therapeutic value in human infertility in 33 of 102 selected patients. Hyaluronidase and the enzyme that liquefies cervical mucus are not identical but present certain parallelisms. The addition of the enzyme papain to hyaluronidase may be of distinct value in patients with nonspecific endocervicitis. Sexual abstinence for a limited period (average about two weeks) does not increase the hyaluronidase content of semen.

Relationship Between the Antipoliomyelitic Properties of Human Nasopharyngeal Secretions and Blood Serums. E. J. Bell.—p. 351.

Endemic Influenza.—Dingle and his associates of the Commission on Acute Respiratory Diseases of the Office of the Surgeon General of the United States Army point out that a possible explanation for the persistence of virus from epidemic to epidemic implies that cases of influenza would be found

repeatedly in a large population in nonepidemic periods if an intensive search were made. The results of such a search for cases of influenza in the flow of military population through a large army post over a period of nearly three and one-half years is the subject of this report. A search for cases of influenza has been carried out at Fort Bragg, N. C., for a continuous period of forty-one months (November 1942 through March 1946) by serologic examination of sets of serums from 2,932 patients admitted to the respiratory disease wards of the station hospital. During this period, both influenza A and influenza B occurred sporadically as well as in epidemic form. Cases of sporadic influenza were difficult to recognize clinically. The conclusion was reached that influenza A and influenza B may be viewed as endemic diseases which periodically erupt in epidemic form. This concept explains the persistence of influenza virus from epidemic to epidemic on the basis of case to case transfer.

Localized Outbreak of Influenza B Preceding Epidemic of 1945.—Dingle and other members of the Commission on Acute Respiratory Diseases describe a localized outbreak of influenza B which occurred in a battery of 230 recruits at Fort Bragg, N. C., late in the summer of 1945. "Recognized" and "inapparent" influenza B infections occurred in approximately equal numbers in the population. The "recognized" infections occurred principally during three weeks in September 1945, nearly two months before the widespread epidemic of influenza B. More than half of the total infections, as determined serologically, were concentrated in one of the four platoons comprising the battery. The persons in the population who had the lower initial antibody titers were predominantly the ones who subsequently contracted a febrile respiratory illness and had the largest increases in antibody titer.

- *Antenatal Selection of Donors for Exchange Transfusion in Erythroblastosis. A. S. Wiener and I. B. Wexler.—p. 296.
- Anesthesia for Plastic Surgery of Face. W. M. Shaw.—p. 303.

Spinal Anesthesia in Peripheral Embolism.—Smith and Rees report 6 cases of lower extremity embolism. In three cases embolectomy was performed and each of these patients received prolonged continuous spinal anesthesia lasting from twenty-six to sixty-nine hours. The remaining 3 patients received a single injection of spinal anesthetic, and in 2 of these it was the only therapy necessary. In the other case the leg was not viable at the time the spinal anesthetic was administered and amputation had to be done. Spinal anesthesia not only relieves vasospasm but also gives complete relief of the severe pain that accompanies this condition. No neurologic changes were noted in the cases in which prolonged continuous spinal anesthesia was employed. It was noticed, however, that the relative duration and effectiveness of the anesthetic agent became progressively less, and in 2 of the 3 cases two agents were used to prolong the anesthesia to sixty-nine hours and forty-three hours, respectively. A total of 4,450 mg. of procaine was used in 1 case over a forty-four hour period. Single injection anesthesia and prolonged continuous spinal anesthesia are valuable aids in the treatment of peripheral embolism. In some instances, surgical removal of the embolus may not be necessary when adequate block of the sympathetic nerves to the involved extremity is maintained.

Blood Pressure During Spinal Anesthesia.—Milwidsky and de Vries measured the intramuscular pressure in the lower and upper extremities of 11 patients under spinal anesthesia to investigate the possible correlation between skeletal muscle tone and fall in blood pressure during spinal anesthesia. Skin temperature measurements were performed in the lower and upper extremities of 21 patients under spinal anesthesia to ascertain the role of vasodilatation in producing hypotension and of compensatory vasoconstriction in preventing it during spinal anesthesia. They found that arteriolar dilatation resulting from vasoconstrictor paralysis in the anesthetized part of the body is the principal cause of the fall of blood pressure during spinal anesthesia. Compensatory vasoconstriction occurs in the area not under the effect of the anesthetic agent. The ratio between the area of vasodilatation and that of compensatory vasoconstriction determines the degree of blood pressure drop in spinal anesthesia. In high spinal anesthesia the majority of vasoconstrictor fibers, including those supplying the upper extremities (fourth to eighth thoracic), are blocked, and hypotension ensues. In low spinal anesthesia a sufficient number of vasoconstrictor fibers are left intact to prevent a major drop in blood pressure.

Antenatal Selection of Donors.—Wiener and Wexler discuss the rationale of exchange transfusion treatment for erythroblastosis. Since the treatment must be carried out as soon after birth as possible, means that would shorten the time between the birth of the child and the institution of treatment are of value. In many instances the group of blood that will be compatible with that of the infant can be predicted if the groups to which the mother and the father belong are known. These are tabulated. A table is also given listing those instances in which the infant's group must be determined before a compatible donor can be selected. A case is presented illustrating the selection of a donor for an exchange transfusion before the birth of the infant. The mother belonged to group AB and the father to group A and an Rh-negative donor belonging to group AB was chosen. The infant later proved to belong to group B. Nevertheless, the donor's blood survived in the infant's circulation for more than two months, a survival time that compares favorably with that obtained when blood of the homologous group is used.

Osteoid Osteoma.—Pritchard and McKay agree with Jaffe that osteoid osteoma is a distinct entity and a tumor. It has often been mistaken for other conditions, such as chronic osteomyelitis, cortical abscess, bone abscess with sequestrum, Brodie's abscess, sclerosing osteitis, osteochondritis dissecans, tuberculosis, bone cyst and even sarcoma, with the result that it sometimes has been improperly treated even to the extent of unnecessarily extensive resections or amputations. It is important, therefore, that it be recognized for the benign tumor that it is, and to know that it can be cured promptly and easily by complete local removal. The authors have encountered 19 of these tumors in the last eighteen years; 8 are recorded in the files of the Montreal General Hospital; 6 were observed by pathologist colleagues in Montreal, and sections of 2 and roentgenograms of 3 were sent from outside sources for an opinion. Of these 19 cases, 15 are selected for this report. Surgical removal of the tumor gave prompt relief from symptoms and a lasting cure in 11 cases. In 8 of these the tumor was removed with the

chisel and curet. Two amputations and one resection done under mistaken diagnoses also gave prompt and lasting cures. A patient in whom symptoms were slight has been advised against operation and has improved under treatment by active exercises. The outcome of this last case will be watched with interest. Judging by the behavior of other cases, the authors suspect that the return and increase of symptoms might necessitate the removal of the tumor. Speculating on the fate of these tumors if left untreated, the authors suggest that it is not inconceivable that the ossified tumor might fuse with the surrounding condensed bone, accounting for some of those foci of osteopetrosis accidentally found in the bones on radiologic examination.

BCG in Prevention of Tuberculosis.—McKone reviews the history of BCG vaccine and discusses the reactions which follow its employment in animals and human subjects. The author's method was the intradermal injection, which he regards as the most simple method; the scarification method seems to be the most widely employed one. BCG vaccine is innocuous and is of definite value in the prevention of tuberculosis. It is recommended for use among those negative reactors destined to live or work in a tuberculous or potentially tuberculous environment. Infants and children whose parents or other members of the family are stricken with the disease, young women planning or already training as nurses and any group working in a sanatorium environment are among those recommended for vaccination.

Molds in Allergic Respiratory Symptoms.—Eisenstadt tested 380 patients who had clinical respiratory allergy with mold extracts; 129 (34 per cent) revealed positive cutaneous reactions to molds. Molds were clinically significant in 111 (29 per cent) of all patients tested. In 42 patients molds were the primary allergen causing symptoms; in 69 patients molds acted as a contributory cause and in 18 patients the cutaneous reactions were of no clinical significance. The age of patients who manifested sensitivity to molds ranged from 2 to 64 years. One hundred and sixteen (90 per cent) were in the 2 to 40 year

age group; 78 (61 per cent) were in the 11 to 30 year span. *Alternaria* and *Hormodendron* were shown to be of major importance, both in relation to abundance of spores and frequency of cutaneous reactions. Other molds have been shown to be clinically significant. Mold extracts should be included in the routine testing of patients with allergic respiratory symptoms.

Erythroblastosis Fetalis.—Heilig and his co-workers report 26 infants with erythroblastosis fetal, 20 of whom were jaundiced clinically within twenty-four hours after delivery. Twenty of the infants survived. Three infants received Rh-positive whole blood transfusions only; 11 infants received Rh-positive whole blood, Rh-negative whole blood and Rh-negative washed red blood cell transfusions. Twelve infants were given exchange transfusions of Rh-negative whole blood. Results showed that abandoning the use of Rh-positive blood transfusions improved the morbidity and mortality. While in some instances infants given Rh-positive blood survived, the majority of them did better with Rh-negative blood. While many infants with erythroblastosis do not require exchange transfusion, a selected group with severe maternal histories and early jaundice were strikingly improved by this procedure, whereas very similar cases treated by periodic transfusions resulted fatally.

Renal Infarction.—Regan and Crabtree discuss experimental and clinical observations on various types of renal infarction and their immediate and remote effects on the anatomy and physiology of the kidney. Diagnosis may be suspected by the internist, confirmed by the pathologist after death, but the

clinical diagnosis rests with the urologist if proper management in the living is to be made. Arterial, venous and traumatic infarction of the kidney are diagnostic and surgical entities encountered with some frequency. An analysis of reported cases indicates certain characteristics of each form of infarction from which diagnosis may be made. Sterile arterial infarction is most common of the three types. It seldom, if ever, requires surgical intervention, but operation is frequently done for sterile infarct, through mistaken diagnosis. Septic arterial infarction is rare. Surgical treatment is indicated. Chronic infarction tends to undergo cystic degeneration occasionally. Arterial infarction is closely associated with cardiac disease. Venous infarction is a serious condition. Its close association in origin with septic states, and the almost invariably infected clots, make surgical intervention imperative when the infarction is unilateral. Venous infarctions frequently, and arterial infarctions occasionally, are accompanied by large subcapsular or perarenal hematomas. Even in the absence of hematoma the kidney is enlarged. Traumatic infarction forms but a small portion of the reported cases. It is dependent on direct injury to the vessels. The most important single time in diagnosis of acute infarction of the kidney is complete, or almost complete, loss of function, almost irrespective of the degree of tissue involvement, in kidneys in which results of pyelographic studies remain unchanged. Chronic infarction is recognizable in proportion to the caliceal atrophy which results from the infarct in its scar stage. Clinical studies of infarcted kidneys parallel closely established experimental work.

Bilateral Familial Pheochromocytoma.—Colston reports 2 cases of bilateral pheochromocytomas which occurred in blood relations. The first was a woman, aged 22, who entered Johns Hopkins Hospital in April 1946 complaining of recurrence of symptoms which had been relieved for a nine months' period by an operation performed four years previously at another hospital. Owing to technical difficulties, it was necessary to leave behind a portion of the capsule. A recurrent tumor apparently developed from this portion of the capsule, and was successfully removed by operation. The hypertensive crises persisted with a positive reaction to a histamine test four months later. A second pheochromocytoma was exposed at operation on the opposite side and was successfully removed. The patient's maternal aunt had been operated on elsewhere nine years previously, and a pheochromocytoma, the entire adrenal gland and the left kidney removed. She was relieved of symptoms for nine months, but the hypertensive crises recurred. A diagnosis of pheochromocytoma on the opposite side was made, and at operation a large tumor was exposed and successfully removed. The first patient has now been well for seventeen months, has had no further hypertensive crises, and reactions to the histamine test are negative, so that as of to date it might be concluded that no further excess of physiologically active chromaffin tissue is present. Case 2 reports that she has been well and has had no return of hypertensive crises for sixteen months. The patient has recently been through a normal pregnancy with delivery of a normal child, and reports that her blood pressure has not been above 115 systolic and 80 diastolic. The author emphasizes the value of the histamine test and discusses the technical difficulties at operation. He suggests that the exposure of both adrenal areas might be more satisfactorily carried out through a transverse incision in the upper part of the abdomen. The advantages of such an approach are obvious, provided that sufficient exposure can be obtained to remove a tumor if one should be encountered.

Aortic Stenosis.—The fact that in their medical wards 2 patients died in one week with advanced calcified stenosis of the aortic valve prompted Kumpe and Bean to investigate this condition. They studied the clinical and morphologic aspects of 107 proved cases of aortic stenosis, uncomplicated by deforming lesions of other valves. Three fourths of the patients were males. A history of acute rheumatic fever was obtained in two thirds of the cases. The authors differentiate between "cardiac" as group I cases and "noncardiac" as group II cases. Group II patients were admitted for infection (endocarditis) and various diseases of old age. Pulse rate was accelerated, but not to extreme degrees, averaging 96 for cardiac patients. Enlargement of the heart was detected clinically in 78 per cent of the patients with cardiac disease and 52 per cent of the others. Muffling of the apical sounds was common. A systolic murmur was heard at the base in 83 per cent of the cases, with transmissions into the neck vessels in slightly less than half. Apical systolic murmurs were heard in 82 per cent of the cases and an apical diastolic murmur was noted in slightly less than one third. Manifestations of congestive heart failure were commonplace but were not of a peculiar variety except for an unusual frequency of sweating. Studies of blood and urine were not helpful, and the electrocardiogram failed to show pathognomonic signs. The course was characterized by signs of congestive failure, which proved rather refractory to digitalis, oxygen or diuretics. Treatment was unsatisfactory. Calcium was found in every valve, and it varied in quantity with the severity of the lesion. In severe lesions the coronary ostia were distorted. Fusion of cusps and nodule formation were common. The hearts were enlarged in the majority of cases and the weight of the heart was related to the valvular obstruction. Coronary arteriosclerosis was common and had given rise to thrombosis and myocardial infarction in a considerable number. Sclerosis was extensive in the abdominal and descending portion of the thoracic aorta. The remainder of the lesions found at necropsy were related to advanced arterial diseases which proved lethal to those in group II. Clinical diagnosis was made in only 24 per cent of all cases, reflecting both unfamiliarity with the diagnostic criteria and too great acceptance of the classic triad of basal systolic murmur, thrill and small, slowly rising pulse.

Remissions in Leukemia Produced by 4-Aminopteroyl-Glutamic Acid.—The occurrence of what he interpreted as an "acceleration phenomenon" in the leukemic process as seen in the marrow and viscera of children with acute leukemia treated by the injection of folic acid conjugates—pteroyltriglutamic acid ("teropterin") and pteroyldiglutamic acid ("dioppterin")—and an experience gained from studies on folic acid deficiency suggested to Farber that folic acid antagonists might be of value in the treatment of patients with acute leukemia. Farber and his associates record the results of clinical and hematologic studies on 5 children with acute leukemia treated by the intramuscular injection of a synthetic compound, 4-aminopteroylglutamic acid ("aminopterin"). This substance is an antagonist to folic acid regarding the growth of *Streptococcus faecalis* R. The authors emphasize that these remissions are temporary in character and that the substance is toxic and may be productive of even

the third chapter Dr. Menninger discusses the relationship of the individual to the social order under such headings as the family, the community, educational facilities and industry, and the role of psychiatry in such phases of the social order as criminology, penology, public health and leadership.

The cataclysmic effects of the last world war on prices, wages, taxes, shortages and national and international policies is discussed and an attempt is made to formulate the relationships between the actual and potential contributions of psychiatry to our present social order. The need for a pooling of the experience of experts in all walks of life, including psychiatry, psychology, sociology and anthropology, toward a solution of our major social problems is mentioned. The potential contribution of the psychiatrist is stated to be to point out not only the psychopathology of everyday life but also some of the factors that cause it and some of the factors that might tend to correct it.

Headache and Other Head Pain. By Harold G. Wolff, M.D., Professor of Medicine (Neurology) and Associate Professor of Psychiatry, Cornell University Medical College, New York. Cloth. Price, \$12. Pp. 642, with 154 illustrations. Oxford University Press, 114 Fifth Ave., New York 11, 1948.

This is a very practical book. The author is an indefatigable physician who is not only a good clinician but is a research man with excellent and honest critique. This work is monumental and was started fifteen years ago when the author was in the midst of studying observations incidental to cerebral circulation. The book contains 629 pages and 154 illustrations. It is written clearly and simply and discusses all forms of headache as well as neuralgias. This work will reveal that the cortex and, indeed, the nerve cells of the brain are not primarily involved in the production of headache but that on the contrary the symptom is likely to arise from fatigued or irritated muscles, from dilated blood vessels, from inflamed meninges, from stretched dura or distorted venous sinuses. Every physician will find answers to many of his problems encountered in his daily practice. There is an excellent bibliography after each chapter.

The Care of the Teeth, Pre-Natal and in Infancy: A Handbook for Mothers and Expectant Mothers. By G. Herbert H. Russell, M.B., Ch.B., L.D.S. Fabrikoid. Price, 2s. Pp. 48. John Sherratt & Son, Park Road, Timperley, Altrincham, Cheshire, 1948.

This 48 page book is composed of eight chapters in all. Part I, chapters I to III, belongs to the expectant mother, and part II, chapters I to V, is assigned to the child, but the chapters are without captions, and there are no references, bibliography or tables. The author gives his view as to care of the teeth. Some points are well worth heeding; especially one might refer to the proper care of the tooth brush, the selection of a toothpaste or powder which the child prefers or will accept, and also the emphasis which he places on the need for restricting foods of any kind after the teeth have been cleaned in the evening before the child retires. The author states as a subtitle that this handbook is for mothers and expectant mothers. It certainly is not directed to the medical profession. Some of the recommendations on gum massage and pressure might be controversial. Even so, the book should be of value to the lay reader.

Handbook of Practical Bacteriology: A Guide to Bacteriological Laboratory Work. By T. J. Mackie, C.B.E., M.D., LL.D., Professor of Bacteriology, University of Edinburgh, Edinburgh, and J. E. McCartney, M.D., D.Sc., Director of Research and Pathological Services, London County Council, London. Eighth edition. Cloth. Price, \$7. Pp. 624, with illustrations. Williams & Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1948.

The eighth edition of this book has been completely revised, taking into account recent developments in bacteriologic knowledge and technic. The subject matter which formed 42 pages in the appendix of the last edition, published during the War, has now been incorporated into appropriate chapters.

The old nomenclature has been retained, although when a name is first mentioned the new names are listed in parentheses. The tendency throughout the book is to reflect the concepts of the bacteriologists of the British Isles; for example, air, water and milk examinations are in accordance with their standards.

This book contains an enormous amount of good practical information for the laboratory worker as well as the clinician.

Gynaecological and Obstetrical Anatomy. By C. F. V. Smout, M.D., M.R.C.S., Assistant Professor, Department of Anatomy, Sub-Dean and Tutor, Faculty of Medicine, University of Birmingham. With chapters on The Histology of the Female Reproductive Tract and Its Endocrine Control, By F. Jacoby, M.D., Ph.D. Second edition. Cloth. Price, \$11. Pp. 248, with 185 illustrations. Williams & Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1948.

The title of the first edition of this book was "The Anatomy of the Female Pelvis," but the book covers much more than this title indicates, including the subject of the placenta and the anatomy of the fetus. There is also a chapter on endocrinology which takes up one-tenth of the entire book and which is apparently considered to be anatomy. Four full pages of references are listed in the chapter on endocrinology. Most of the illustrations are highly instructive. A large number of the illustrations are in color and most of these are original. At least two colored plates are reproduced twice (figure 59 opposite page 66 is the same as figure 154 opposite page 201, and figure 62 opposite page 70 is identical with figure 104 opposite page 142). The roentgenogram shown in figure 14 was poorly reproduced. Aside from the three subjects mentioned the subjects covered in the book are the bony pelvis; the pelvic ligaments and joints; the pelvic connective tissue and fascia; the development, histology and endocrine function of the ovary; the anatomy and histology of the uterine tube; the development, anatomy and histology of the uterus and vagina; the genitourinary and alimentary tracts within the pelvis, the external genitalia; the perineum; the pelvic lymphatic system, and the innervation of the pelvic viscera. The price of the book is unusually high (\$11) in view of the fact that the book contains only 248 pages and only 185 illustrations and that most of the contents can be found in the leading textbooks on obstetrics and gynecology. However, the appearance of this edition indicates that apparently the book is popular and fulfils a definite need.

Ilustraciones obstetricas. Por los Doctores Gerardo Will y Oscar Agüero, médico-parto, adjunto del Servicio No. 2 de la Casa Municipal de Maternidad "Concepción Palacios." Caracas. Prólogo por el Doctor Leopoldo Agüerevere, profesor de clínica obstétrica de la Universidad central de Venezuela. Paper. 31 plates with explanatory matter. Casa municipal de Maternidad "Concepción Palacios," Caracas, 1946.

This series of obstetric illustrations consists of only 23 photographs and for this reason the authors purposely avoided the use of the term "atlas." The photographs were made from cases observed at the "Concepción Palacio" maternity hospital, where more than 6,000 women are delivered each year. The illustrations represent a variety of abnormalities; twelve depict congenital disturbances and anomalies in the newborn. The maternal conditions shown are a normal pregnant uterus, perforation of the uterus, rupture of the uterus, purulent endometritis, tubal pregnancy, abdominal pregnancy, placenta previa with twins, rupture of the hepatic capsule in a case of toxemia, papilloma of the vulva, Werlhof's disease in pregnancy and hydatid mole. The illustrations are clear and instructive and form a useful collection for any one interested in obstetrics.

Introduction to Medical Psychology. By L. Erwin Wexberg, M.D., Director, Bureau of Mental Hygiene, District of Columbia. Cloth. Price, \$3.50. Pp. 171. Grune & Stratton, Inc., 381 Fourth Ave., New York 16, 1947.

In this 162 page book the author has given a concise and accurate review, in both theory and practice of medical psychology, for the beginner and even for some presumably more advanced students. There is an excellent bibliography and a good index. This book is highly recommended as a textbook, particularly for beginners in the field.

Standard Radiographic Positions. By Nancy Davies, M.S.R., C.T., Senior Radiographer, Malvern General Hospital, Malvern, London, and Ursel Isenburg, M.S.R., Radiographer, Royal Free Hospital, London. Second edition. Cloth. Price, \$6. Pp. 223, with 384 illustrations. Williams & Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1948.

This is a rather elementary text, but it should serve well for the earlier stages of instruction of radiologic technicians. The text is brief but clear. The illustrations, mostly line drawings, are clear. The text seems peculiarly fitted for classes of instruction on radiologic technic and to serve as a guide for the occasional radiographer. A good exposure chart accompanies the text.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE ANSWERED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THIS WILL BE OMITTED ON REQUEST.

PROTECTION FROM SYPHILIS IN SURGERY

To the Editor:—How long are spirochetes found in the circulating blood in untreated syphilis: (a) after a primary chancre; (b) in an older person with positive Wassermann reaction but no demonstrable lesion of syphilis; (c) in operating on a patient with a positive Wassermann reaction, what is the minimum treatment needed so that the surgical staff will be protected in case of a punctured finger by a needle?

M. A. Shillington, M.D., Glendive, Mont

ANSWER.—(a) and (b). It is difficult to answer these questions in terms of exact time and dosage. In general, the blood is not a suitable medium for the growth of syphilitic organisms, and probably they leave it as soon as possible for the more favorable environment of other tissues, particularly those of ectodermal origin. Animal experimentation—and an occasional unfortunate experience with a blood transfusion in human beings—indicates that spirochetes may be harbored in the blood for a period beginning shortly after inoculation (before the appearance of the chancre) and extending through the stage of secondary eruption. Sometimes after the spontaneous healing of the secondary eruption, there may be a series of recurring lesions, especially on the mucous membranes of the mouth or genitalia. These relapsing lesions contain organisms in large numbers, and it is likely that during these periods organisms may be distributed in the blood stream. In some patients, however, such recurrent lesions may never appear, and in most they cease to recur by the time three to five years have elapsed. There have been rare instances, however, of such lesions appearing even after two decades of latency. Stokes suggests that the infection of the child in utero in the mother with a latent syphilitic infection of years' standing is also conceivably explainable through a transient spirochetemia associated with the revival of a visceral latent focus. Fruhwald has succeeded where most others have failed in demonstrating the infectiousness of blood from persons with latent syphilis. Yet there is the report of McNamara, who by circumstances was forced to use the blood of 6 persons with late syphilis in nineteen transfusions for 10 recipients in whom he was unable to demonstrate a single transfer of syphilis. It would seem, therefore, that in an older person with latent or late syphilis, it is unlikely that organisms are present in the blood stream.

(c) The older the infection the less risk to the surgeon, and after five years the risk of infection via needleprick is practically nil. The chance of infection is greater during the first two years of the disease and lessens with time. Even during the early period infections from needleprick are exceedingly rare and should be a source of worry only if the surgery is of an emergency character. Otherwise two or three injections of an arsenical drug administered to the patient forty-eight to seventy-two hours preoperatively will usually suffice to protect the surgeon. If penicillin is used, a total of 2,400,000 units should be administered over a period of four days.

WAR GAS DFP IN GLAUCOMA

To the Editor:—Discuss use of war gas in the treatment of glaucoma.

Serge Tolstoi, M.D., Paris, France.

ANSWER.—Diisopropyl fluorophosphate (DFP) was originally synthesized as a war gas; its marked miotic action prompted investigation of its efficacy in glaucoma. It acts by inactivation of cholinesterase and is capable of producing prolonged and decided parasympathomimetic effects in the eye. Clinically 0.05 to 0.2 per cent solutions in peanut oil are suitable for reducing tension in some cases of chronic glaucoma simplex. In general, when other miotics, as pilocarpine or physostigmine, fail to control the tension DFP has little chance of success. Its chief advantages, when it satisfactorily controls tension, are infrequency of administration and absence of a local sensitivity reaction. Complications of DFP therapy are a severe eye or brow ache, blurring of vision caused by a variable ciliary spasm, pericorneal infection and occasionally an increase rather than decrease of intraocular pressure.

TOXIC VAPORS

To the Editor:—Please give me information concerning the toxicity of and symptoms resulting from the following substances "freon," methyl chloride and "mineral spirits." These in vapor form are the only apparent agents which might be responsible for my patient's apparent toxicity. She states that rather large volumes of methyl chloride blow into her face at work.

M.D., Wisconsin.

ANSWER.—Freon is dichlorodifluoromethane (CCl_2F_2). Although this compound embraces chlorine and fluorine this fact is without significance to toxicity. Apart from representing a simple asphyxiant when it replaces oxygen in respired air, it is not known to be harmful to health. Mineral spirits is a trade rather than a chemical term applicable to one fraction in the distillation of petroleum oil. For toxicologic purposes it may be regarded as not different from naphtha of the same boiling point. Mineral spirits is a well known producer of dermatitis. Its vapors may produce the well known "naphtha jag," an acute state resembling alcoholic intoxication. Long exposure to its vapors may lead to chronic naphtha poisoning, a rare and possibly dubious entity. This condition as described resembles multiple sclerosis. Methyl chloride (CH_3Cl) falls into a higher order of toxic agent. This substance may produce either an acute or a chronic state. In the former its narcotic action dominates the clinical picture and a fair number of deaths have occurred, chiefly associated with leaks in refrigeration systems employing methyl chloride as the refrigerant. The proposed tolerable limits of exposure are 10 parts per million not exceeding a total of eight hours daily. Mild intoxication is characterized by headache, dizziness, confusion, nausea and vomiting. In more direful instances greater involvement of the nervous system, such as convulsions and later coma, may appear. The decomposition of methyl chloride may evolve formates and methyl alcohol. Chronic poisoning simulates methyl alcohol poisoning, which may be accompanied by nephritis, anuria and ocular disturbances, possibly representing optic neuritis. At autopsy petechial hemorrhages have been observed, notably of the pleura and other chest contents.

LATE CONGENITAL SYPHILIS

To the Editor:—I have under my care a 5 year old child with congenital syphilis. Physical examination including examination of eyegrounds does not reveal abnormality. The blood Wassermann reaction is 4 plus, but the spinal fluid reaction is negative. To avoid intravenous therapy I plan to alternate eight weeks of bismuth subsalicylate with four weeks of sulfarsphenamine. Both are to be administered intramuscularly for the next one and one-half years. What are other plans of therapy for this case?

M.D., Pennsylvania.

ANSWER.—The method of treatment described has been thoroughly tried and is effective. In late latent congenital syphilis the purpose of treatment will be to prevent progression in the form of gummatous breakdown of bone, liver or skin or the development of interstitial keratitis. A negative spinal fluid study at this time would insure against the development of other serious late complications of the nervous system such as nerve deafness, juvenile paresis or tabes. As little as fifteen weeks of treatment with arsenicals and appropriate heavy metal compound given to children over 2 years of age with congenital syphilis has been shown to prevent the development of interstitial keratitis in 98 per cent of cases (Cole, H. N.; Usilton, L. J.; Moore, J. E., and others: *Ven. Dis. Inform.* 18:97 [April] 1937). The possibility of causing the blood serologic reaction to revert to negative as a result of treatment is not good when commencement of therapy has been delayed to this age, certainly not better than 30 to 40 per cent.

An alternative method of intramuscular arsenical therapy which has been widely used employs bismuth arspenamine sulfonate ("bismarsen"). H. Beerman, B. Shaffer and C. Livingood have described the follow-up results with this method of treatment (Bismarsen for Treatment of Syphilis, *J. A. M. A.* 120:333 [Oct. 3] 1942). For a 5 year old child the weekly dose of this drug should be about 0.2 Gm., the injections given continuously for forty weeks followed by about ten weekly injections of bismuth subsalicylate to complete the treatment.

Since the introduction of penicillin in the treatment of syphilis, this drug has been used widely in the management of infants and children with this disease. Relatively little information is available as yet as to the value of this drug in the treatment of late latent congenital syphilis. It has been inferred that it is probably effective, however, from the fact

that the remedy has proved equal or superior to others in the symptomatic forms of the disease, such as infantile congenital syphilis with open lesions, late congenital syphilis with involvement of skin, bones or central nervous system. Penicillin has the advantage that the treatment is less toxic and less likely to produce reactions and that the course of therapy may be completed in a few days rather than prolonged over a period of weeks or months. Post-treatment observation in such a case as is under discussion should cover three to five years at least, if penicillin is used, with periodic clinical and laboratory examinations. Recommended penicillin dosage at this age would be in the same amount approximately as employed in the adult and would be in the magnitude of 40,000 Oxford units every three hours intramuscularly for one hundred and twenty injections if the crystalline G form is used in aqueous solution. This would be a total of 4,800,000 Oxford units given over a period of fifteen days. Such a method would require hospitalization. Probably equivalent dosage of penicillin in oil and wax or procaine-penicillin could be given once daily and thus on an ambulatory basis would produce results similar to those of the aqueous preparation. Even though this is being used, still less is known of the results of this therapy in such cases. It can only be considered for treatment on an experimental basis. Articles by A. W. Neilson and others (*Arch. Dermat. & Syph.* 53:625 [June] 1946) and J. Yampolsky and A. Heyman (*J. A. M. A.* 132:368 [Oct. 19] 1946) mention the treatment of late congenital syphilis with penicillin.

VASODILATORS IN PERIPHERAL VASCULAR DISEASE

To the Editor:—What is the present status of histidine plus sodium ascorbate in peripheral vascular disease?
M.D., Pennsylvania.

ANSWER.—The combination of histidine with sodium ascorbate as suggested by Wirtschafter and his associates has led to a vast amount of abuse and misdirected treatment. The following principles must be observed in evaluating any vasodilators for the treatment of peripheral vascular disease:

1. Temporary vasodilation may be accomplished by a multitude of drugs, operating through different mechanisms, but there is nothing to suggest that a few hours of vasodilatation exert any lasting benefit on obliterative vascular disease.

2. A gangrenous part is dead and nothing will revive it; waiting for demarcation simply means that the attending surgeon does not exactly know the level of circulatory efficiency. This can be determined by simple clinical methods and amputation should be undertaken at this level. Waiting for demarcation often leads to septicemia, especially in persons with diabetes.

3. When an increase in blood flow to a poorly vascularized part is desired it is far more useful to increase blood flow locally than to produce a systemic vasodilation, since this must be accomplished by a shifting of blood volume from one area to another, thus producing undesirable side reactions.

4. Regarding the specific question, the published reports are inconclusive, since bed rest, cessation of smoking and aseptic care of the lesion are potent factors of improvement. One Midwestern clinic has given the method a careful unbiased trial and concluded that its use was not to be recommended.

ROTENONE

To the Editor:—Please give information on use of rotenone (from derris root) as a spray on vegetables. People in this area are eating it to kill amebic and worm infestations. They report it more efficacious than the usual medical treatment. Please advise regarding toxicity. Where may rotenone be obtained? Homer D. Hoskins, M.D., Oceanside, Calif.

ANSWER.—Rotenone, a crystalline neutral principle, is present as the active constituent of derris root, a common plant in the South Pacific islands, and in cubé root, a South American plant. It is used by natives as a spear and arrow poison. In this country it is used as an insecticide in spraying vegetable crops; the residue left on the plants is not poisonous to birds or mammals. It is estimated that a person would have to eat 4,000 apples sprayed with derris to obtain an acutely fatal dose. The fatal dose for a 70 Kg. man has been estimated to be 4 or 5 Gm. Relatively smaller amounts, however, have produced fatty changes in the liver and pulmonary irritation in mammals as well as gastrointestinal irritation, but again it is estimated that 1 to 2 Gm. daily would be well tolerated by a man. Rotenone has been used effectively

against scabies in a 10 per cent emulsion. It is stated (Crane, D. B.: *Cornell Veterinarian* 23:15, 1933) to be effective against round worms, but ineffective against tapeworms in dogs. It would appear that no extensive studies of its use in worm infestations in human beings has been made. Rotenone may be obtained from S. B. Penick & Co., 735 W. Division St., Chicago 10, Ill.

ARTHUS PHENOMENON

To the Editor:—While in the army, I had under my care a puzzling case of angioneurotic edema. The findings of the angioneurotic edema were incidental in this case and not the primary cause of admission and were treated when they arose. My impression is that "adrenalin" is one of the useful specifics for this type of reaction; however, in this case it accentuated it and "adrenalin" alone was capable of reproducing it. I can find no discussion in the texts at hand of this type of toxic reaction to "adrenalin." Specifically, this patient after 0.1 cc. of 1:1,000 subcutaneous injection of "adrenalin" within one-half hour exhibited several irregular macular purplish red areas about the size of coins over back; chest, face and arms which increased in size with time and produced pseudopodial extensions which after about one hour demonstrated edematous areas in the center. Intense pruritus occurred. The reaction subsided in about twelve hours. Please give suggestions for diagnostic tests and treatment. Stanley M. Rubin, M.D., Yonkers, N. Y.

ANSWER.—"Adrenalin" (epinephrine) is a preparation of extract of adrenal glands marketed by the Parke-Davis Company. It contains, in addition to the glandular product, chlorobutanol and sodium bisulfite as preservatives. The unusual reaction in this case could be due to any of the three ingredients. The first step would be to substitute a synthetic epinephrine for the "adrenalin," for it has been observed that persons sensitive to the glandular product may sometimes tolerate the synthetic preparation. Then, by means of percutaneous tests, determine the presence of sensitivity first to sodium bisulfite and then to chlorobutanol, using the same concentrations that are present in "adrenalin," 1:1,000. Both urticarial reactions to "adrenalin" and local Arthus phenomenon following the injection of epinephrine, although rare, have been observed.

ACETYSALICYLIC ACID AND SULFONAMIDE DRUGS

To the Editor:—Is aspirin contraindicated while a sulfonamide drug is being taken?
Bernard Marcus, M.D., Raritan, N. J.

ANSWER.—Theoretically, there is no contraindication from a pharmacologic standpoint for the simultaneous administration of acetylsalicylic acid and a sulfonamide drug. One practical disadvantage, however, would be that the antipyretic action of acetylsalicylic acid might mask a drug fever, which is one of the early signs of sulfonamide toxicity.

THYROID MEDICATION IN PREGNANCY

To the Editor:—Will thyroid extract in small doses during the second and third trimesters of pregnancy induce premature delivery of the fetus? Does hypometabolism (low basal metabolic rate) frequently recorded during pregnancy possess clinical significance?
M.D., Maryland.

ANSWER.—Evidence that small doses of thyroid precipitate early labor is lacking. The evidence and general consensus indicate the opposite to be true. It is for this reason that many physicians almost routinely give small doses of thyroid during the first two trimesters and also to women with fertility problems to prevent abortion.

The basal metabolism tends to rise during pregnancy, particularly toward the end, the average figure quoted being plus 4.5. This may account for the fact that many women feel much better than usual during pregnancy.

The whole subject of basal metabolism presents many problems, including the test itself. One should not rely on the basal metabolism test too completely but should use other tests and signs, such as blood cholesterol, pulse on awakening in the morning and the other general signs and symptoms of lowered metabolism.

It appears natural for the metabolism to rise during pregnancy, because even during sleep the maternal organism is working harder than usual to produce and nourish the fetus.

GARGOYLISM

To the Editor:—Other than general and orthopedic care is there any therapy of value in the treatment of lipochondrodystrophy (gargoylism)?
M.D., Tennessee.

ANSWER.—There is no known treatment of value for this condition.

MEDICAL CRITICISM OF MODERN AUTOMOTIVE ENGINEERING

Chairman's Address

FLETCHER D. WOODWARD, M.D.
Charlottesville, Va.

Having been impressed by the rising number of deaths and injuries occasioned by the automobile, it occurred to me that by studying the types and mechanisms of these injuries certain facts could be determined which would prove that many of these deaths and injuries could be prevented by modifications in automotive design.

Statistics of the National Safety Council, in its last full year's report, revealed that there were 33,700 deaths in motor vehicle accidents in 1946—an increase of 20 per cent over 1945. Injuries were approximately 1,200,000. Costs, including property damage, totaled about \$2,200,000,000. This means 1 death every fifteen and a half minutes and 1 injury every twenty-six seconds, or that during the thirty minutes consumed in the presentation of this paper 2 deaths and 68 injuries will have taken place in this country. The magnitude of the problem is to some extent shown in a chart (fig. 1) from the National Safety Council's annual report.¹

To combat this appalling carnage, so evident to the physician who is called on to treat the victims at all hours of the day and night, it is obvious that the physician should combat it by his influence and as his duty as a citizen, as well as a professional person.

In the first place, he should urge the teaching of safe driving to teen-agers in high schools, since the death rate in the 15 to 24 year age group in 1946 was 33.8 per 100,000 population—a figure exceeded only by the rate among persons of 65 or older. Further, a considerable number of these elderly victims were pedestrians. In 5,521 high schools out of 25,300, classroom driver education is offered, and 545 schools also provide actual behind the wheel instruction. Two million boys and girls reach driving age each year, of whom 50 per cent become drivers. A study by the American Automobile Association of young men drivers graduated from Cleveland High Schools indicated that the accident rate of those who received training in high

school was substantially lower than the accident rate of those without training.

Since approximately 15 per cent of all accidents involve mechanical defects, the physician should urge frequent spot checks of automobiles by the state police. Since drivers with physical defects are involved in about 8 per cent of the fatal accidents, he should urge periodic and careful reexamination of all drivers at least to help in the reduction of this smaller percentage.

From a professional point of view, the American Medical Association has already recognized its interest and responsibility in regard to this problem by appointing a committee, headed by Dr. Herman A. Heise, of Milwaukee, to study motor vehicle accidents, and the Board of Trustees has also ordered the publication in THE JOURNAL of an annual report on this subject.

This committee, in conjunction with other similar committees of special societies, should be in a position to set up minimal standards of physical fitness as a guide to state police in their examination of prospective drivers and in their periodic reexamination of all drivers. In establishing such minimal requirements, it would be necessary to consider visual acuity, visual fields, depth perception, night blindness, persistence of dazzle, hearing, reaction time and many other physiologic qualities involved in the operation of the automobile. However, in defense of drivers with physical defects, I would like to quote a statement of Mr. W. C. James, Director, Statistical Division, National Safety Council, in a personal communication. He stated, "I think the actual experience of drivers with some physical defect, as indicated by state reports, tends to bear out my belief that most drivers with defects, particularly where those defects are for the most part corrected by mechanical devices, are able to compensate for those defects sufficiently to drive a car safely in noncommercial operations." Considerable work has already been done on chemical tests for the determination of critical levels of alcohol in the blood and urine for use in the detection of the drunken driver.

In studying the types of accidents as seen in the University Hospital of Virginia, certain injuries were observed to predominate. These are injuries to the face and head (figs. 2 and 3), usually caused by impact of the head against the dashboard, the windshield or the rear of the front seat. Crushing injuries to the chest of the driver occur when he is driven against the steering wheel (fig. 4). Injuries to the hip (fig. 5), pelvis, patella and femur (fig. 6) are caused by the protective rotation of the body when propelled forward on impact. Injuries to the elbow (fig. 7) are usually caused by a blow to the elbow when projecting from the window and usually affect the driver. Of course,

many other types of injuries occur, of greater or lesser degree, but these comprise the most serious and the most frequent in our experience. Associated with many of these are internal injuries to the abdominal viscera, lungs and brain. Some of the victims suffer from severe shock and subsequently die.

Studying the reasons for and mechanics of these accidents makes obvious that redesign of the automobile can prevent many. The opinion that automotive engineering is of professional interest to the physician may appear at first glance as rather ill founded. However, a study of the types of injuries encountered and the close relationship between engineering and medicine, as exemplified during the past war (particularly in aviation medicine), should convince the most doubtful of the advantages in such a relationship to the safety of

in the last two or three years, despite heavy increases in traffic volume, there is still much to be done. In the early 1930's approximately 16 persons were killed for every 100,000,000 miles of motor vehicle travel. In 1947 fewer than 9 persons were killed for every 100,000,000 miles. This reduction in mortality rate

the passenger. A few of the aeronautic problems requiring such joint application of knowledge were: (1) parachute harness design, (2) of escape hatches, (3) design of the positioning of flight instruments, (4) shape and placement of control handles, (5) design of oxygen equipment and the pressurization of cabins, (6) flight clothing, (7) cockpit standardization, (8) the ejection seat and (9) crash injury prevention, ditching procedures, air sea rescue equipment and technic—to mention only a few.

In airplane design, the engineer has realized that performance is dependent on two distinct factors, the machine itself and its operator. The same is equally true of the automobile, its record on the highways depending on both the characteristics of the machine as well as those of its driver.

Although the motor vehicle accident rate has been substantially reduced over the years, and particularly

Fig. 1.—An analysis of traffic accident fatalities, 1946.

can be attributed to the indefatigable work of the National Safety Council and the many other organizations and persons who were interested in this problem. Without this reduction there would have been close to 60,000 deaths in 1947, as compared to the 32,000 which actually occurred.

However, in spite of the success of these campaigns, the automobile still remains a lethal and crippling agent, and since there appears to be little likelihood of accomplishing radical changes in human nature in general and exuberant youth in particular, it would seem the

Fig. 2.—Facial contusion and laceration from dashboard or windshield.

part of wisdom to shift the emphasis, for the moment at least, to desirable alterations in the machine itself, rather than to place all emphasis on attempts to bludgeon "old Adam" into safer driving practices.

Our highways are becoming increasingly laden with cars driven by average persons, and it appears inevitable that these machines will continue to collide, pass on

turns, fail to observe stop signs, leave the road at high speeds and afflict mankind much as they have in the past.

A shift of thought away from the fields of "safety regulations" and "law enforcement" has resulted in the suggestions to be presently advanced which are intended as measures to save life and prevent injury when automobiles are mismanaged.

SUGGESTIONS FOR SAFETY

Speed.—Speed was a factor in two out of five fatal accidents,¹ and in many of our most serious accidents it was the main factor. Whenever a driver is involved in an accident while operating faster than conditions warrant, speed is reported as a factor in the accident, although this speed may be no more than 15 to 20 miles per hour. However, in 20 per cent of the accidents¹ in which speed was a factor, the speed was greater than 50 miles per hour. The problem of high speeds could be solved simply by the use of governors on all cars, limiting the top speed to 55 miles per hour, but in no way interfering with acceleration at lower speeds. Since one is inclined at first hand to assume that the public will not tolerate such control, it might be interesting

Fig. 3.—Depressed fracture frontal bone, from impact against rear of front seat.

to quote from a survey made by the Traffic Engineering and Safety Department of the American Automobile Association.² The following questions were asked, among many others. "If a simple device were developed to limit the top speed without affecting acceleration at lower speeds, would you favor its incorporation in new passenger cars?" Of the 4,102 replies received, 4 persons answered "yes" for each 3 that answered "no." The top speed in the group favoring governors was 55 miles per hour.

STRUCTURE

Frame and body of welded "unit construction" would be helpful. Such structure should also include "crash struts," as found in aircraft.

Windshield and Windows.—Windshield and windows should be made of "a plastic material," in order to eliminate cuts from broken glass, a common finding in accident victims. A windshield which ejects on impact is at present standard equipment on one of the newer automobiles and should, no doubt, prevent many injuries. However, "a plastic material" instead of safety glass will give added protection. While special cleaning

materials and technics are required, its use in aircraft is universal and satisfactory. The same material should also be used in headlight lenses. Both windshield and rear windows should more nearly revert to the vertical, for better visibility, particularly important in rain, sleet and snow.

Fig. 4.—Severe crushing injury of the chest from steering wheel, with fractured ribs, pneumothorax (right) and interstitial emphysema.

Doors.—Single doors should be standard, with windows large enough to serve as escape hatches and high enough to prevent passengers from riding with their elbows comfortably protruding. Sponge rubber elbow

Fig. 5.—Dislocation of hip, from body rotation on impact.

rests would take care of passenger comfort. The door latches should be operated both from rear and front seats, with the safety lock on the front latch, to prevent the opening of the door by children.

² Research Report no. 29, American Automobile Association Traffic and Engineering Department, July 1, 1946.

Bumpers.—The front bumper should be mounted on "oleo shock absorbers," in a manner similar to the landing gear in airplanes, which quickly and efficiently absorbs the shock of the heaviest planes on landing, even when poorly executed.

Fig. 6.—Multiple fractures of femur, from impact against dashboard.

Tires.—(a) Tire treads should be designed to give maximum traction and to provide the best antiskid qualities, on the basis of actual tests by some disinter-

Fig. 7.—Fractured elbow, from side swipe while elbow was protruding from car window.

ested agency. (b) Danger from blow-outs should be eliminated as far as possible by the use of blow-out-proof tubes, even at the expense of some riding comfort, if necessary.

Interior Devices.—(a) A glare-proof rear view mirror, for night driving; (b) a latch to lock the backs of front seats in position in the coach type cars, to prevent the added impact of them to the front seat passengers in sudden stops; (c) safety belts, such as are used as standard equipment in aircraft—their use might well be one of the most effective single factors in preventing serious injury; (d) a hydraulic steering column which will move forward under a force of approximately 100 foot pounds—this would do much to prevent chest injuries of the driver from forceful impact against the wheel; (e) crash pads—the installation of sponge rubber padding on the dash and back of front seats would eliminate many of the head injuries so common today—and (f) elimination of all projecting handles, knobs, buttons and such items from the interior and also from the exterior wherever possible.

Exterior Lighting.—The importance of exterior lighting to safety is apparently well appreciated by the Interstate Commerce Commission, but has been neglected by the manufacturers of passenger cars. Such lighting

Fig. 8.—Design of car embodying proposed safety devices, as drawn by Stewart Rouse, *Popular Science Monthly*, April 1947, in article by Devon Francis, "Cars Can Be Safer."

should include: (a) red reflectors at corners of fenders and top, (b) blinking turn indicators front and rear. (c) large stop light and dual tail lights and (d) luminous paint on outside margins of trucks, trailers and busses and consideration of its use for strip marking on highways.

Vision.—(a) The provision of the largest possible visual field is of the utmost importance. This should be of a full 360 degrees, with top-supporting columns reduced to a minimum compatible with safety in the event of turning over. Front supporting columns should be moved further to the rear.

Lowering and shortening of the hood would give a much better view of the roadway, especially on sharp hills. In the Automobile Association of America's survey,² two thirds of the replies checked the driver's view of the roadway as the most important single factor in body design. Less than 1 in 6 voted for appearance. More nearly vertical windshields and rear windows have been previously mentioned.

(b) Shiny, reflecting surfaces should be eliminated from the driver's visual field. This could be simply

accomplished by eliminating all chromium trim and by painting the top of the hood and dash a nonreflecting dull optical black. The use of such paint on metal aircraft has long been an established convention.

(c) The speedometer should be placed at the top of the instrument panel, directly in front of the driver, since it is his most important instrument. In addition to the miles per hour, it should also include the stopping distance in feet under average driving conditions, as a constant reminder for safe driving. Both the speedometer and other dials should be illuminated by means of a "Navy red" light to maintain the driver's dark adaptation at night. A flashing red light or auditory signal might well be included to indicate the maximum safe speed of 55 miles per hour. Again, the Automobile Association of America's survey noted four fifths of their replies voted for dials to be located for easy reading. Finally, the light switch should be placed on the driver's side of the panel and designed to eliminate error when operated by "feel."

(d) The use of a polarized windshield to minimize glare from the highway would be of particular value and, when coupled with oppositely polarized headlight lenses, "blinding" in night driving would be eliminated. The added cost could, no doubt, be largely absorbed by the elimination of clocks which do not run, radios, radiator ornaments and other useless gadgets which are now included in the cost of an automobile whether wanted or not.

(e) More adequate defrosters and windshield wipers should be provided. This defrosting and wiping equipment should be installed at both windshield and rear windows, and the wipers should be so designed as to wipe a larger area than at present.

COMMENT

There is an abundance of evidence (obtainable from air crash reports) that the adoption of construction methods and safety features now employed by the aviation industry would render it at present possible to build motor cars capable of withstanding collisions, leaving the road at high speed and overturning, with greatly reduced likelihood of injury to their occupants, as well as reducing the likelihood of such accidents. It is suggested that a cooperative attempt by the automotive industry and the medical profession to produce such vehicles would be well worth while, especially since the automotive industry will be soon faced with the design of radically different vehicles (fig. 8).

The magnitude of the medical, economic and social problems entailed by the continued use of the motor car in its present form far outweighs in importance any monetary consideration arising from the necessarily high costs of such research and new design. The only influence of aircraft design apparently so far adopted by automotive engineers is the erroneous one that the aerodynamic principles of a jet-propelled aircraft should be applied to a vehicle the speed of which should be limited to 55 miles per hour on the ground.

I agree with Mr. A. W. Stevens, President of the Automobile Safety Association of Boston, when he says, "Automobiles should be redesigned to stress safety rather than speed and appearance. This suggestion has often been made, but has been religiously disregarded by automotive engineers and manufacturers."

I also agree with a recent editorial in the *Times Dispatch*, Richmond, Va., in a discussion of this problem, which concluded with this statement: "Disregard of human life has always been the measure of barbarism. If we are to become more civilized, we must place the

value of human life above the prestige value of speed and appearance in motor cars."

It is my confirmed belief that ultimately the design of the automobile will include installations necessary to the reasonable safety of its passengers. Meanwhile, it is interesting to speculate as to the traffic casualty incidence which will be tolerated before some concerted action along these lines will be taken—2,000,000 casualties annually? 3,000,000? It would be to the credit of the medical profession generally if the impetus toward furnishing the public with a safer means of transportation should be supplied from among their number.

CLINICAL PROBLEMS IN PENICILLIN SENSITIVITY

SAMUEL M. PECK, M.D.
SHEPPARD SIEGAL, M.D.
ARTHUR W. GLICK, M.D.

and
ABNER KURTIN, M.D.
With the Technical Assistance of
ROSE BERGAMINI, B.A.
New York

With the rapidly increasing use of penicillin, the problems surrounding the management of patients who manifest reactions to this drug assume immediate practical importance. It is the purpose of this paper to describe some of the forms of reaction which we have encountered, with emphasis on the allergic eruptions following systemic administration, to evaluate the diagnostic and prognostic significance of the penicillin cutaneous test and to present our experiences with penicillin desensitization.

CLINICAL MATERIAL AND METHODS

The persons tested for sensitivity to penicillin and trichophytin included 406 adults, 250 men and 156 women, and 91 children, ranging in age from 2 months to 12 years. Of the 406 adults, 276 had never had penicillin and 130 had received the drug in varying amounts. Of the children, 65 had had no penicillin and 36 had received it.

Tests were performed by the intradermal method, readings being made either at forty-eight hours for the delayed reaction or at fifteen minutes for the immediate response. To induce the latter reaction, the standard allergic test dose, 0.01 to 0.02 cc., was employed; for the former test, 0.1 cc. of penicillin solution was injected. In the course of these experiments several brands of commercial penicillin in many different lots were used, but all reactions to these were checked by a simultaneous cutaneous test with crystalline penicillin of known potency. In the early days of this work the crystalline penicillin used was that of the Food and Drug Administration; later, other crystalline preparations were used.

Our standard cutaneous test for the delayed intradermal reaction employs 2,000 units, or about 1.2 mg., of crystalline penicillin in 0.1 cc. of isotonic solution of sodium chloride. A good, preferably light-colored, commercial preparation of the amorphous form may be substituted if necessary, or the preparation with which the patient's reaction may have developed may be used. Then, it is best to use a crystalline penicillin or a known nonreactor as a control, for some reactions may be due to factors other than the penicillin.

Additional tests employed included the immediate intradermal reaction, for which the same concentration of crystalline penicillin may be used, although with a smaller test wheal, as already indicated. Amorphous preparations are more likely to give non-

From the Dermatologic and Medical Services of the Mount Sinai Hospital.

This work was supported by a grant from the Lederle Laboratories, Inc., Pearl River, N. Y.

specific wheals; with these it is best to use a solution of 5,000 units per cubic centimeter concentration.

The trichophytin preparation employed was freshly made in our laboratory from *Trichophyton mentagrophytes* according to a method previously described.¹ The trichophytin tests were performed in the standard manner, with a 1:30 dilution in 0.1 cc. of isotonic solution of sodium chloride. Readings were made at forty-eight hours and again, on occasion, at three to five days.

TESTS OF PENICILLIN SENSITIVITY

The Delayed (Forty-Eight Hour) Cutaneous Test.—The most important test of penicillin sensitivity is, in our opinion, the delayed reaction to the intradermal injection of penicillin. It was first described by Welch and Rostenberg,² who noted its occurrence in 5 per cent of 140 persons who had had no previous treatment with penicillin. When performed with 2,000 units (1.2 mg. of crystalline penicillin G in 0.1 cc. of isotonic solution of sodium chloride and readings made forty-eight hours later, the test offers a reliable index of penicillin sensitization. The reaction to this test is similar to that of the trichophytin test. The character-

Photograph showing, A, characteristic positive reaction to the intradermal penicillin test (2,000 units) after forty-eight to seventy-two hours, and, B, a positive reaction to trichophytin. This patient, who never had penicillin, is one with so-called spontaneous sensitivity.

istic of the reaction at its height is an area of erythema, often rather vivid, which is usually associated with edema or infiltration. This induration may be prominent enough to give the resulting lesion a plaquelike appearance. The reaction area is at least 1.0 cm. in diameter, but it may reach three times this size and may be studded with small papules and even vesicles. Rarely, central necrosis may be observed. As with the trichophytin test, the largest diameter of the area of reaction may not be reached until three to five days after testing and the lesion may persist for a week or longer, gradually disappearing, with scaling. Local pruritus is a common accompaniment of the reaction to the test.

In several instances, we have shown that measures which destroy the antibiotic potency of penicillin also

abolish its antigenic activity, as indicated by its capacity to elicit a delayed type of specific positive cutaneous reaction. This parallelism is strong evidence that the cutaneous reaction is due to penicillin itself and not to any other factor which might be present, even in the crystalline product. The exquisite sensitivity of some patients is indicated by the results of tests with small quantities of penicillin. In 1 patient, a positive reaction could be elicited with 5 units, or approximately 0.0025 mg., of crystalline penicillin. In another patient, a measurable reaction of erythema occurred to 5 units and was still visible when only 2 units, or 0.0012 mg., of penicillin G was used. In this patient comparable sensitivity on cutaneous test was shown to pure penicillin X as well.³

The Patch Test.—In our hands this test was of doubtful value as an index to general penicillin allergy. Our series does not include the forms of dermatitis following topical application of the drug, in which the patch test may be of greater usefulness. Applied in ointment form, with 1,000 to 2,000 units of penicillin per gram, in a base of hydropur wool fat U. S. P. and petrolatum, the test gave a negative reaction in 63 patients. When employed as a dry patch containing 100,000 units of amorphous penicillin, the test also yielded negative results, except in persons with pronounced sensitivity, as proved by the graded intradermal test. With the technique which we employed, the penicillin patch test could not be relied on as a sensitive indicator of penicillin allergy.

The Immediate Intradermal Cutaneous Test.—Reactions to this test, in which whealing was looked for after ten to fifteen minutes, were negative in our series. The test was performed on 82 subjects who had received penicillin without reaction, and also on 10 patients in whom an eruption of the urticarial type had occurred as a result of penicillin treatment. In every instance the reaction was negative. The urticaria does not accompany the positive reaction to the penicillin test of the delayed type. In 3 patients with urticarial reaction to penicillin, tests using a penicillin-human plasma albumin complex gave negative results. That this preparation contained active penicillin was proved by elicitation with it of a delayed type of positive reaction in a suitable subject.⁴

CLINICAL REACTIONS TO PENICILLIN

Other investigators reported a variety of reactions to penicillin encountered both on topical application and on systemic administration. These reactions ranged from localized dermatitis to widespread eruptions and included many of the manifestations associated with serum sickness. In subjects who reacted more violently, hyperpyrexia, asthma, pulmonary edema and vasomotor collapse were observed. Our own experience dealt wholly with the two major, relatively common types of reaction to systemic treatment with penicillin: type 1, reactions of the urticarial, serum-sickness-like type, in which sensitization is induced by treatment; type 2, reactions with an erythematovesicular eruption, resembling the trichophytids.

Type 1: Reactions of the Urticarial, Serum-Sickness-Like Type.—The urticaria and the erythemas, together with joint pains and fever in some instances, occurring after a definite incubation period, comprise the com-

monest allergic reaction to penicillin. Because of the time needed for development of the newly induced sensitivity, the reaction was called the delayed type by Kolodny and Denhoff.⁵ Not rarely it manifests itself only several days after treatment with the drug has ended. In rare cases this interval may be as long as three weeks. Severe reactions, with angioneurotic edema, asthma, hyperpyrexia and pulmonary edema, have been described. Some reactions which occur on second or subsequent administration of the drug may be of the accelerated type, with a short or no incubation period. This acceleration is comparable to what may occur on readministration of other drugs (e.g., the sulfonamide compounds) or serum.

In 25 of our patients (21 men and 4 women) reactions developed which were of this type. The eruption varied from slightly patchy erythema of a transient character to pronounced, generalized urticaria of considerable severity. Macular erythemas not of an urticarial type were common. In several patients the eruption was limited to the buttocks and thighs. In most instances there were none of the accompanying manifestations that simulate serum sickness. However, in 2 patients there was a rise of temperature, and mild joint pains were noticed by several others. In most subjects, the eruption had followed intramuscular injections, but in 1, tablets taken orally in good-sized doses for one day only were sufficient to elicit a typical serum-sickness-like reaction nine days later. Other reactions of this kind have been reported to us, and it is apparent that the oral route is not a safeguard against them. In another patient the urticaria followed bronchoscopic instillation. In all subjects the eruption cleared within several days, although we have been informed of rare instances in which urticaria after penicillin therapy continued several weeks.

The usual incubation period was seven to twelve days. For 1 patient it was as long as eighty days, while he was receiving continuous therapy. In 2 subjects the reaction began on the second or third day. One of these patients had a definite history of previous treatment with the drug. For the other patient there was no explanation, unless the patient had failed to give an accurate history on this point.

In 10 subjects—all men—the cutaneous test gave a positive reaction. The reaction to the trichophyton test was positive in only 4 subjects—all men. While a positive reaction to a penicillin test is helpful in confirming a diagnosis of this type of allergy, a negative reaction does not exclude it. Since the reaction to penicillin may be positive in more than one third of such persons, the test is worth doing in an effort to prove that an eruption is due to penicillin. Thus, the test might have practical value when several medications are being given simultaneously. The problem then arises as to which drug is responsible for the eruption and whether the penicillin must be discontinued.

The incidence of the delayed type of positive reaction to the penicillin test in this group of patients, amounting to 40 per cent, was far greater than that in the group who had never received penicillin. The so-called spontaneous positive reaction, as has been noted by other investigators, occurred in about 5 per cent of such persons routinely tested. The close correlation of the results of the forty-eight hour cutaneous test with penicillin and the clinical sensitivity to the drug was further borne out by another observation. Of 98 patients who had received penicillin without reaction,

not 1 reacted positively to the cutaneous test. Of all patients receiving penicillin whom we tested, 130 in number, 17 had a positive cutaneous reaction of this type, an incidence of 13.4 per cent. The expected incidence of positive reactions in a group that had not received penicillin, as judged from our own observations and the experience of others, would be about 5 per cent, or 6 patients. The conclusion is justified that the more frequent occurrence of the positive reaction after penicillin treatment is itself the result of induced sensitization to the drug. Among 36 children 12 years of age or less who had received penicillin, 1 had a positive reaction to the penicillin cutaneous test.⁶ Two other children had an eruption during treatment which was believed to be due to the drug, but the test gave a negative reaction.

Of particular interest is the preponderance of men among persons receiving penicillin who gave a positive reaction to the cutaneous test with penicillin after forty-eight hours. All 17 patients with a positive reaction were men. This striking predominance is noted throughout all types of penicillin sensitivity, whether urticarial or erythematovesicular or of the latent "spontaneous" type.

The immediate intradermal test was also performed on 10 of these patients, with negative results. In 3 subjects this test was performed with a penicillin-human plasma albumin complex, as well as with crystalline penicillin, but the result was negative for each form.

Thus, with the urticarial type of penicillin allergy, an eczematous cutaneous test lesion appears to be the best objective index of sensitivity. This manifestation is an instance of a discrepancy between the cutaneous test and the clinical lesion of the disease. Whether the eczematous response is due to concomitant epidermal sensitization, perhaps to seepage along the needle track, is a matter of speculation. Perhaps the sharp demarcation of the vascular allergic reactions from the epidermal reactions, which is a generally accepted hypothesis, requires modification, particularly in some instances of penicillin allergy.

The induced urticarial form of penicillin allergy is often temporary, even transient, in character. This observation is in accord with that of Lyons⁷ who expressed the view that this form of penicillin allergy is transient and does not usually recur with readministration. Thus, in 1 of our patients large areas of patchy erythema, as well as typical urticarial wheals, appeared on the trunk two months after the beginning of treatment. The use of the drug was continued, however, with the aid of tripeleminamine hydrochloride N. N. R. ("pyribenzamine hydrochloride"), and, ultimately, the mild eruption disappeared and did not recur. Similar observations were made on a number of our patients and may be found in the literature. In 2 patients of this group whose reactions to the cutaneous test were positive, retests made fifteen months later gave negative results.

However, exceptions occurred, such as in the young man who had had severe urticaria and joint pains after bronchoscopic instillations of penicillin and who still had a positive reaction to a penicillin cutaneous test of the forty-eight-hour type eighteen months later. He also reacted with a mild, general pruritic eruption after only a few doses of the drug on two occasions three and fifteen months from his initial reaction.

6. This boy, 12 years of age, had a general urticarial and a local eczematous reaction on the buttocks.

7. Lyons, C.: Penicillin Therapy of Surgical Infections in the U. S. Army. *J. A. M. A.* 123:1007 (Dec. 18) 1943.

One of the patients in this group had a previous history of mild urticaria. On cutaneous testing with standard allergens, a positive reaction was obtained to timothy extract, but other tests gave negative results, including that of *Penicillium* spore extract. Two other persons with urticaria due to penicillin, who are not included in this series, had a history of allergy. However, the majority of our patients gave no history of allergy.

A basic practical point is the preponderance of this form of penicillin allergy, as with the other form, among men. Of 25 patients in this group, 21 were men and 4 women. In view of these statistics, allergic reactions to penicillin can be anticipated to occur at least three times as frequently among men as among women (table 1). There is a comparable low incidence among children. We encountered only 3 cutaneous eruptions in a group of 36 children receiving penicillin.

In the management of patients with this form of penicillin allergy, treatment with the drug is usually stopped if the indication for its use is not urgent or the reaction is a severe one. However, if the need for penicillin is great and the reaction mild, the penicillin may be continued with the aid of symptomatic medication, such as

Type 2: Reactions with Erythematovesicular Eruptions, Trichophytid Type.—This form of penicillin sensitivity may be conceived of as existing in a latent and in an active stage. The former stage is characterized by no clinical phenomenon but simply by the presence of a positive reaction to the forty-eight hour penicillin cutaneous test without a history of previous administration of the drugs. This reaction is the so-called spontaneous one of the tuberculin type, to which attention was first called by Welch and Rostenberg.² The active stage, based on the preexisting latent sensitivity, is that of the characteristic erythematopapulovesicular eruption, which tends to localize primarily on the hands and feet and in the groins. It often becomes generalized and may start on the trunk, but the most intense portions of the eruption are likely to be on the hands and feet. Here it develops most fully, often progressing to a severe vesiculobullous reaction, which may become pustular. General desquamation is usual, and, if acute, the reaction takes on the character of an exfoliative dermatitis. Pruritus may be intense. Milder instances, with only slight interdigital vesiculation or exfoliation of the palms, also occur.

epinephrine and the antihistamine drugs. The problem will arise of the readministration of the drug to patients who have had a previous urticarial, or similar, reaction. Such factors as the type and severity of the reaction and the interval since its occurrence should be taken into consideration. Substitute medication, such as the sulfonamide compounds, ought not be forgotten. If it is decided to use penicillin again, it is probably wise to give a few tests or provocative doses at intervals of six hours. Should these doses fail to elicit a reaction, treatment may be started, but preferably in small doses at first, such as 2,000 to 3,000 units every three hours. Dosage may be gradually increased during the next several days.

A preliminary cutaneous test might be useful in patients with a history of reactions, but an accurate reading cannot be expected before twenty-four hours. If the reaction is positive, it would suggest even greater caution, as persistent clinical sensitivity is then much more likely. In all cases with a history of previous reaction, it is unwise to give large doses, to employ the oil and beeswax preparation, or to administer the drug intravenously without preliminary tests of the type suggested. In some instances, it may be necessary to resort to desensitization. This procedure will be discussed later. Again, it may be emphasized that the induced sensitivity to penicillin is often temporary, and the drug is tolerated well on readministration.

MECHANISM OF "SPONTANEOUS" SENSITIVITY

Latent Stage.—Among 276 adult ward patients who had never received penicillin, there were 15 with a delayed positive reaction to a penicillin cutaneous test. This incidence of 5.4 per cent confirmed the earlier report by Welch and Rostenberg² of an incidence of about 5 per cent. Of 168 men who had received no penicillin, 11 showed a positive reaction to the penicillin test. Of 108 women, 4 reacted positively. Of 65 children, none had positive reactions.

Welch and Rostenberg² attributed this form of positive reaction to exposure to *Penicillium* spores from inhalation or handling. However, several later studies indicated a more probable explanation for this apparent "spontaneous" sensitivity to penicillin. The observation, first made by Graves, Carpenter and Unangst,⁸ of the occurrence of vesicular eruptions on the hands and feet following penicillin treatment suggested to the workers a relation between these eruptions and previous fungous disease of the skin. Their observations have been confirmed by other investigators.⁹

Kolodny and Denhoff.⁵

A significant clue to the mechanism by which dermatophytosis may induce a positive reaction to the penicillin test, ultimately leading to the eruptions of this type, is to be found in the work of Peck and Hewitt.¹⁰ These investigators showed that common pathogenic fungi, which are responsible for many of the dermatomycoses, are capable of producing an antibiotic substance possessing many of the properties of penicillin. This report is another link in the chain of evidence which makes it entirely probable that in the course of fungous infection of the skin sensitization to penicillin takes place in much the same way as sensitization to trichophytin.

The positive reaction to the trichophytin test may be taken as an index of existing sensitivity to this fungous extract and as an indication of past or present fungous infection. The relation of the positive penicillin reaction to the trichophytin reaction is therefore of great interest (table 2). Trichophytin tests carried out simultaneously in the patients who had not had penicillin treatment showed positive reactions in 92, or 33.3 per cent. Among the 15 penicillin-positive patients, there were 9 who were also trichophytin positive, or an incidence of 60 per cent, almost twice the incidence among penicillin-negative persons.

On the other hand, 6 patients with this form of penicillin sensitivity were trichophytin negative. One must conclude that these patients were sensitized in

with *Penicillium* spore extracts. Moreover, in several subjects with positive reactions to penicillin, the reaction to *Penicillium* extract was negative. Furthermore, the percentage of patients sensitive to penicillin among trichophytin-positive persons was 9.7 per cent, as against 3.2 per cent among trichophytin-negative persons. This incidence offers further evidence of the role of fungous infection in the development of penicillin sensitivity. Additional evidence of the relation between fungous infection of the skin and trichophytin sensitivity, on the one hand, and "spontaneous" penicillin sensitivity, on the other, is found in our observations on 65 children, ranging from 2 months to 12 years of age. In none of these children was the reaction to either the penicillin or the trichophytin test positive. None of them had received penicillin. These negative findings, supported by previous statistical analyses which revealed that children below 12 years of age rarely show a positive trichophytin reaction, thus coincide with the suggested hypothesis (table 2).

It may be noted that of the 15 patients with a positive reaction to penicillin of the delayed type, 11 were men and only 4 were women. Of the 11 men, 8 also reacted positively to trichophytin. The greater tendency among men to latent penicillin sensitivity recalls the higher incidence of trichophytin sensitivity previ-

some other manner, or that in some persons cutaneous infection with a fungus may not induce a positive trichophytin reaction, or that the reaction was only temporary or below the threshold of elicitation. However, these explanations lack force in that trichophytin sensitization appears to occur readily, as indicated by the high incidence of a positive reaction to the fungus among the general population, usually estimated at about 40 per cent.¹¹

Because of the characteristics of the "spontaneous" positive reaction to the penicillin cutaneous test, one may assume by analogy with other similar reactions, whether trichophytin or to tuberculin, that active infection of the body with a fungus capable of producing either penicillin or a closely related substance must have occurred at one time or another. Such an infection may conceivably have involved some tissue other than the skin, such as the lungs. The character of the test itself bespeaks either actual epidermal sensitization, such as might occur with external contact or in dermatophytosis, or the allergy of infection, as in the positive tuberculin reaction. Sensitization from inhalation of *Penicillium* spores could hardly be expected to lead to a reaction of this type. Experience with large groups of atopic persons in this area indicates a low incidence of immediate positive wheal reactions to cutaneous tests

usually observed among men. Thus, in 776 subjects tested by Peck and associates,¹¹ 48 per cent of the men were sensitive to trichophytin, as against 29.9 per cent of the women. It is of some practical value to know that it is particularly among men with dermatophytosis, or with a positive reaction to the trichophytin test, that a "spontaneous" positive reaction to penicillin is most likely to occur. It may be pointed out that there was a preponderance of men in the group with induced penicillin sensitivity, 21 men to 4 women. All 11 patients in the urticarial group with a positive reaction were men. The tendency for men to become more readily sensitized to penicillin is underscored by the observations on group 2, the 7 patients of which were men. The explanation for this sex preponderance is at present obscure. It will be interesting to see whether other series of cases of penicillin sensitivity reported from civilian hospitals support this observation.

CLINICAL SIGNIFICANCE OF THE "SPONTANEOUS" POSITIVE REACTION

In many instances the reaction appears to be a reliable index of general latent hypersensitiveness which warrants great caution in the administration of penicillin. The following case is informative:

C. V., a 40 year old Puerto Rican man with mild, quiescent dermatophytosis, had had no penicillin previously. On cutaneous test, Sept. 8, 1946, he showed a positive reaction to commercial preparations of both amorphous and crystalline penicillin, 2,000 units in 0.1 cc. isotonic sodium chloride solution U. S. P.

10. Peck, S. M., and Hewitt, W. L.: The Production of an Antibiotic Substance Similar to Penicillin by Pathogenic Fungi (Dermatophytes), *Pub. Health Rep.* 60: 148 (Feb. 9) 1945.

11. Peck, S. M.; Botvinick, I., and Schwarz, L.: Dermatophytosis in Industry, *Arch. Dermat. & Syph.* 50: 170 (Sept.) 1944.

The reaction to the latter preparation was the larger, showing an area of erythema 1.5 cm. in diameter and edema with papules. The trichophytin test gave a 4 plus reaction. When the patient was retested six months later, March 3, 1947, the area of reaction to penicillin was 3 cm. in diameter. Desensitization was begun, but the procedure caused some local reactions. On March 12, to determine whether a mild reaction could be elicited, he was given instructions to take penicillin tablets. Although warned to stop the medication at the first sign of eruption or pruritus, he took 300,000 units orally for two days and 600,000 units on the third day. After the first few doses generalized pruritus was noticed, and a general erythematopapular eruption appeared, starting at the sites of previous penicillin tests and injections, but involving especially the fingers and palms and toes in an acute vesiculobullous eruption. By March 17 the eruption was fading, but desquamation of the palms was still noticeable on March 28. A retest of penicillin, 1,000 units, on March 26 produced an area of erythema 1.0 cm. in diameter, but no induration. This area was less than would have been expected in view of the severe preceptive reaction to 2,000 units. It was concluded that the patient was in a stage of relative desensitization as his eruption subsided. Indeed, it may be inferred that the mechanism by which the eruption is terminated is related to the reduction in sensitivity which may follow a violent reaction. Further desensitization was carried on by hypodermic injection of small doses of penicillin at intervals of forty-eight hours, but it could not be completed because the patient lapsed from treatment.

This case demonstrates clearly the clinical significance of the positive reaction to a penicillin cutaneous test as an index of true hypersensitivity. It is also clearcut proof of the relation of the preexisting latent stage of penicillin sensitivity to the development of the erythematovesicular form of eruption which follows penicillin treatment. The presence of dermatophytosis and a strongly positive reaction to the trichophytin test complete the picture.

Such experiences suggest caution in the administration of penicillin to any patient with latent sensitivity to the drug. If there is time, and especially if the reaction is strongly positive, showing sensitivity to as little as 50 units, desensitization by one or another of the technics to be described later should be initiated. If the indication is urgent, perhaps administration of the drug can be started, but in smaller doses than usual, with a gradual increase during the next three to five days. This procedure may avoid an intense reaction, and might even have a desensitizing influence.

On the other hand, a positive reaction does not inevitably indicate that a general reaction will occur to penicillin treatment. Thus, patient L. G. had a moderate positive reaction to penicillin, but four months later he was able to tolerate the drug by aerosol inhalation in good dosage, and 40,000 units intramuscularly every three hours as well, without cutaneous eruption or other untoward effect. It is not known whether at the time of penicillin administration the cutaneous test still elicited a positive reaction.

In 2 persons the reaction was still positive after intervals of twelve and eighteen months, respectively. In 2 other subjects it was positive after intervals of four and six months, respectively, and the reaction might have persisted longer but for desensitization. However, in another subject who was observed after an interval of fourteen months, the reaction, which had been slightly positive, became negative. It is certain, then, that in some persons this type of sensitivity is persistent, perhaps in much the same way as a positive trichophytin reaction. Recognition of this fact carries certain practical implications. Inasmuch as the need for penicillin may arise at any time, it seems

logical to recommend desensitization to such patients. At the least, the patient should be informed of his sensitivity and advised to mention it to his attending physician whenever penicillin treatment should become necessary. The situation is analogous to that of the patient who is sensitive to horse serum and who may require serum therapy at some time.

It seems to us wise to perform a cutaneous test with penicillin on all patients for whom treatment with the drug is planned. Examples of these nonurgent indications are its use after an operation or when a course of aerosol penicillin is to be given for bronchiectasis. It might be well, too, to give the test even when penicillin must be started without delay because of an immediate indication, such as an acute infection. The test will serve at least as a warning and a guide if its reaction is positive. A negative reaction does not, of course, preclude the possible development of the induced form of urticarial sensitivity (group 1).

Active Stage.—The eruption occurring during penicillin treatment is reminiscent of the "id" of dermatophytosis.¹² Unlike the eruption in the induced form, the reaction can occur within the first day or two, even on first administration of penicillin. However, it may not occur until the eighth, or even the eleventh, day after the beginning of treatment. Severer degrees of latent sensitivity probably become manifest with smaller amounts of the drug.

All 7 subjects in this group had a positive reaction to the penicillin cutaneous test. The trichophytin reaction was likewise positive in each of these subjects. The much higher incidence of positive penicillin and trichophytin reactions in this group than in the group with the urticarial form of reaction is significant, as indicative of preexisting sensitivity and its relation to fungous disease.

In 1 subject the cutaneous reaction to penicillin remained positive for three months, or until desensitization was started. In another person, the reaction was still positive and unchanged after a six month interval. As was pointed out in the discussion on latent sensitivity, the reaction in 2 such patients was still strongly positive after more than a year. From these observations, it is our impression that the allergy to penicillin of this type is more persistent than the urticarial type. When a reaction has occurred, it may well occur again if the drug is given in full dosage.

The clinical management of this type of sensitivity requires more caution than that of type 1 sensitivity, because of its tendency to greater persistence and because the cutaneous reactions are likely to be severer. The danger of extensive exfoliation is to be borne in mind; pruritus is often intense. Fever and joint pains are absent, but edema, especially of the face and eyelids, is common in the severer grades of reaction. For these reasons, penicillin treatment usually must be stopped.

The decision to readminister penicillin should be guided at least in part by the cutaneous test and by the intensity of the previous eruption. If the reaction was strongly positive, or could be elicited with as little as 50 units, and, if the reaction was severe, it would be safest to desensitize the patient. If time does not permit desensitization, then the possibility of substitution of sulfadiazine for penicillin should be remembered. When the need for penicillin is urgent and the reaction only slightly positive, or, perhaps, when it is

12. It might be justifiable to refer to such eruptions as "penicillids," for the antigen eliciting them is penicillin, just as the trichophytid can be elicited by trichophytin.

not possible to await the result of the test, single provocative doses may be tried, or treatment may be started in low dosage.

When a patient has a history of this type of reaction, but the cutaneous reaction is found to be negative, it should be possible to proceed with treatment cautiously in low, and then ascending, doses. In such patients desensitization can probably be dispensed with.

METHODS AND RESULTS OF PENICILLIN DESENSITIZATION

As already indicated in the discussion on the management of cases of systemic penicillin allergy of both the urticarial and the erythematovesicular type, persons with either form may require desensitization in order to permit readministration of the drug. With type 1, the induced urticarial form, desensitization may seldom be needed, whereas with type 2, the erythematovesicular dermatitic form, it may have to be resorted to frequently.¹³

Desensitization was attempted in 8 patients. In 7 patients, desensitizing doses were given subcutaneously; with 1 the oral method was used. Any plan of desensitization implies treatment with graded increases in dosage kept below the reactive level of the patient's sensitivity. A positive cutaneous reaction offers a useful guide to desensitization. Successful desensitization is accompanied with conversion of the positive reaction to negative. When the reaction is negative to begin with, it is first of all necessary to establish that the patient is still sensitive. When this fact has been demonstrated, the patient's reactions must be employed as a guide to increases in dosage.

A typical average schedule of dosage for subcutaneous desensitization is given in table 3. The interval between injections, as well as the dosage, may be varied to some extent, depending on the degree of the sensitivity and the necessity for rapid desensitization. Thus, if the patient shows no reaction to 400 units intradermally, this amount can be used as the beginning dose. In some instances daily injections were given. We have found, however, that desensitization cannot be pushed too rapidly in most instances.

PATIENTS WITH NEGATIVE REACTIONS

In persons with urticaria whose reaction is negative, the question always arises whether sensitivity is still present. An attempt at reelicitation of the reaction is the only certain method of establishing this point beyond doubt. The dose and route of administration of penicillin for this purpose will depend, among other things, on the severity of the previous reaction, the time interval since it occurred and factors of convenience, such as whether the patient is in the hospital or is ambulatory. The most convenient form of oral administration is in form of tablets. Thus, a single dose of 50,000 units can be given on an empty stomach the first thing in the morning. If no reaction of any kind occurs, the dose might be repeated before bedtime. The next day either three or four tablets could be taken. On the third day, if no reaction has been observed, six tablets, or 300,000 units, could be given in divided doses.

When the previous reaction has been severe or when, for other reasons, it is of paramount importance to avoid all semblance of reaction, penicillin solution can

be given dropwise at first, and the doses, given in tablet form, may be increased slowly over several or many days. With such a technic, the efforts at reelicitation are, for all practical purposes, transformed into a method of desensitization. While it may be useful to proceed in this manner when time permits, the method does not actually disclose whether the patient retains his sensitivity or whether he can tolerate full therapeutic dosage without undue delay.

URTICARIA WITH A POSITIVE CUTANEOUS REACTION

In a young man a severe urticaria developed on the twelfth day after initiation of bronchoscopic instillation of penicillin. The reactions to the penicillin and trichophyton tests were positive. Intramuscular injections of even moderate amounts of penicillin caused local swellings and an increase in the eruption. The desensitizing injection could not be increased rapidly without pronounced local, and even general, reactions. The initial dose had to be as small as that given in table 3 and increased slowly, with the larger doses at intervals of three or four days. It took three months to increase from 400 to 20,000 units. Even in the next two weeks the dose could not be increased above 25,000 units, and the cutaneous reaction to 2,000 units was still positive, although reduced. In the following six

TABLE 3.—*Desensitization Schedule for Subcutaneous Administration*

Injection	Number of Units
1.....	200
2.....	400
3.....	800
4.....	1,200
5.....	1,600
6.....	2,000
7.....	2,500
8.....	3,000
9.....	5,000
10.....	10,000
11.....	15,000
12.....	20,000

The interval between injections may be two to three days. When more rapid desensitization is necessary, daily injections may be given. If the patient is extremely sensitive, the initial dose may be as low as 50 units, and subsequent increase in dosage much more cautiously tried. Should a local reaction or a rise in temperature occur after the increase in dosage, the subsequent dose is that which elicited no reaction, and increments should be smaller.

weeks, injections were continued at the convalescent home. For the last week or more of treatment, 30,000 and 35,000 units were given daily. At the end of that time, the cutaneous reaction had become negative to 2,000 units; the trichophyton test still caused a positive reaction. In an effort to evaluate the degree of desensitization, penicillin was administered orally in increasing dosage; 2,500,000 units were given altogether, as much as 600,000 daily without a cutaneous or other reaction.

Erythematovesicular Type.—Of our patients with type 2 sensitivity, 1 with successful desensitization permitting the therapeutic application of penicillin in effective dosage has been reported on previously.¹⁴ For that patient the subcutaneous method was also used, and took three weeks for completion. A follow-up report revealed that in four months after desensitization the patient was again able to tolerate penicillin well, this time in doses of 50,000 units every three hours intramuscularly for several days. He refused to have a repetition of the penicillin test at this time.

A parallel case is one in which subcutaneous desensitizing doses were given daily or every other day, requiring a month for reversal of the cutaneous reaction to penicillin to negative. Penicillin given orally in doses up to 600,000 units per day for two days then elicited no eruption.

13. Pillsbury, D. M.; Steiger, H. P., and Gibson, J. E.: The Management of Urticaria Due to Penicillin, *J. A. M. A.* 135:1255 (April 26) 1947.

14. Peck, S. M.; Siegal, S., and Bergamini, R.: Successful Desensitization in Penicillin Sensitivity, *J. A. M. A.* 134:1546 (Aug. 30) 1947.

Patients with Latent Sensitivity.—Desensitization of patients with a "spontaneous" positive cutaneous reaction to penicillin in the latent stage of type 2 sensitivity has been carried out successfully in 3 cases. In 1 case it was accomplished slowly over a six week period; injections were given every three to seven days, the patient being ambulatory. The cutaneous reaction remained negative thereafter over a follow-up period of eighteen months. Penicillin in oil and wax, 300,000 units, caused no reaction. This observation suggests, as does the experience with other patients, that this method when successful may result in permanent desensitization. However, it is possible that reactivation of fungous infection in the skin, or elsewhere, might reintroduce sensitivity.

In the second case, desensitization with production of a negative cutaneous reaction was accomplished by use of the same method in a four month period. However, retests eight months later showed a reversion to a moderately positive reaction to penicillin. Subcutaneous desensitization is being attempted again. In this instance, then, desensitization was temporary.

Desensitization had to be discontinued in 1 case because of mild general reactions, chiefly pruritus. However, the patient was uncooperative in the extreme.

Oral Desensitization.—In the third case desensitization was accomplished wholly by the oral route. Crystalline penicillin was first administered dropwise in a solution containing 5,000 units per cubic centimeter. In this way, small amounts, less than 1,000 units a day, can be given initially. This concentration was increased to 20,000 units per cubic centimeter. After three weeks tablets of crystalline potassium penicillin were given, at first 100,000 units a day, later as much as 500,000 units daily. The latter dose had to be decreased because of heartburn and headache and, when treatment was continued at 300,000 to 400,000 units daily reversal of the penicillin cutaneous test to negative resulted. In this patient a high degree of cutaneous sensitivity of the "spontaneous" type had been present both to penicillin G and penicillin X, the skin reacting with erythema to as little as 2 units, or 0.0012 mg., of crystalline sodium penicillin G.

Desensitization may be attended with great difficulty when there is an unusually high degree of latent penicillin sensitivity, as demonstrated by the quantitative graded penicillin cutaneous test. The difficulties of desensitization of an extremely sensitive patient with epidermal and anaphylactic reaction to penicillin were presented by O'Donovan and Klorfajn.¹⁵ They succeeded in partial desensitization by means of prolonged administration of penicillin in tablet form.

It is our clinical impression that in the patient with type 2 sensitivity desensitization cannot be rushed without the risk of unpleasant local or general reactions. Among patients with urticaria, it is possible that desensitization can be accomplished more quickly in those who are not extremely sensitive.

Therapeutic Desensitization.—When the need for penicillin is urgent, a modification of the usual technic is suggested, employing so-called therapeutic desensitization. Such patients should be under close observation, preferably in a hospital. After an initial provocative dose of from 1,000 to 5,000 units, depending on the degree of previously observed sensitivity, penicillin might be given every three hours in the same dose for the first twenty-four hours. Evidences of a reaction

should be looked for after each injection and before the next dose is given. On each day following, the dose can be increased until an adequate therapeutic dose is obtained. It is likely that the tendency to lose penicillin sensitivity spontaneously, which has already been noted as frequent among persons with type 1 sensitivity, can be hastened with judicious employment of this technic.

SUMMARY AND CONCLUSIONS

Four hundred and six adults and 93 children were tested with penicillin and trichophyton. The reaction to the forty-eight-hour cutaneous test with penicillin was observed to possess clinical significance and practical diagnostic value. The technic of performing and reading this test is described. Other tests are presented and discussed, but their reactions were not found significant.

Of 276 adults who had never had penicillin, 15, or 5.4 per cent, reacted "spontaneously" to the penicillin cutaneous test. Of 168 men, 11, or 6.5 per cent, reacted positively; of 108 women, 4, or 3.7 per cent, showed a positive reaction. Of 65 children, none reacted positively. The "spontaneous" reaction caused by penicillin sensitivity was three times as frequent among those patients who had a positive trichophyton reaction.

Of 130 patients who received penicillin, 32 had cutaneous eruptions. Of these eruptions, 25 were of the urticarial serum-sickness-like type; 7 were of the erythematovesicular, trichophytid type. In 34.2 per cent of all men eruptions developed, whereas they occurred in only 8.3 per cent of women.

In this group, all 17 positive reactions to penicillin cutaneous tests occurred in men, or 13.4 per cent of all patients.

Of the 25 patients in the group with urticaria 21 were men and 4, women. Of these patients, 10 had a positive reaction to the cutaneous penicillin test, and 4 had a positive trichophyton reaction; all were men. A previous instance of fungous disease is not considered to play a role in this form of induced sensitivity.

The 7 patients with the erythematovesicular type were men, each of whom had positive reactions to both the penicillin and the trichophyton test. The previous occurrence of fungous disease, which gave rise to penicillin sensitivity resulting in a "spontaneous" positive reaction to penicillin, is considered the basic mechanism of this type of sensitivity.

The delayed reaction to the penicillin cutaneous test is of practical value in the diagnosis of "spontaneous" sensitivity; it serves as an aid in preventing generalized eruptions prior to penicillin therapy and as a guide to dosage for desensitization.

Parenteral and oral methods of desensitization are described, and the results in 8 cases are presented.

140 East Fifty-Fourth Street (22).

ABSTRACT OF DISCUSSION

DR. H. N. COLE, Cleveland: With every new drug, one of the first questions is what reactions follow its use. Only after a period of observation did the dangers from the use of the sulfonamide compounds begin to accumulate. Thus, it is timely that this problem be brought before the Section on Dermatology. Many physicians have seen evidences of sensitization from the use of penicillin. The earliest reactions were apparently of the localized type, due to intimate contact with the drug, and they affected nurses who mixed the prescribed doses for local injections, physicians who handled the drug and, more recently, a chemist and some industrial workers engaged in its manu-

15. O'Donovan, W. J., and Klorfajn, I.: Sensitivity to Penicillin: Anaphylaxis and Desensitization, *Lancet* 2: 444 (Sept. 28) 1946.

facture. Only later were the generalized systemic reactions studied, and by this time a large literature on the subject has accumulated. The reactions seem to be mostly of the (a) urticarial serum-sickness type, rarely accompanied with effusion into the joints, but with symptoms of the skin and mucous membranes resembling angioneurotic edema, and of the lungs resembling an acute attack of asthma and pulmonary edema; (b) erythematous eruptions on the skin, which rarely take on the characteristics of erythema multiforme or erythema nodosum, and which even more rarely progress into an exfoliating dermatitis. Occasional cases of fixed eruption have been observed. Thus far, cases of involvement of the hematopoietic system have, fortunately, been almost nonexistent, and this is not strange, for apparently penicillin does not involve the blood-forming organs. I am glad that Dr. Peck and his co-workers emphasized the use of an intradermal dose of 2,000 units, or about 1.2 mg., of crystalline penicillin in 0.1 cc. isotonic solution of sodium chloride, with the reaction read at the end of forty-eight hours, and that they brought out the fact that with a large dose a nonspecific reaction is possible. Their point is well taken that immediate intradermal tests are of no value and that the patch test is useful only in contact cases—when a dry patch test of 100,000 units amorphous penicillin should be employed. They also emphasized that a positive reaction to an intradermal test is helpful in confirming a diagnosis, while a negative reaction does not exclude it. The writers are to be commended for their emphasis on the fact that almost 5 per cent of 276 ward patients who had never received penicillin had a positive reaction after forty-eight hours to the intradermal cutaneous test and for their emphasis on its relation to a positive reaction to the trichophytin test and to the presence of a chronic dermatophytosis. Fungous infections may play a role in producing a sensitivity to penicillin.

DR. E. MYLES STANDISH, Hartford, Conn.: The clinical significance of the forty-eight hour penicillin test now seems to be definitely established. This work also substantiates the observations of other investigators of a definite relation between penicillin and trichophytin antigens. The mechanism of this reaction should receive further exploration. What happens to the trichophytin test in some of the positive penicillin reactors having negative reactions to trichophytin tests? Perhaps an explanation might come from the study of children who have had identified fungous disease. Normal children are negative to both tests. A 25 per cent expectancy of positive cutaneous reactions among adults from penicillin therapy seems high. One out of every 3 men have reactions, in contrast to only 1 of 30 children. Checks on these interesting prognostic observations should be made. That fungous disease plays little or no part in the induction of urticarial sensitivity is contradicted by the figures on children. Children have negative reactions to both tests and are relatively free from fungus. On the basis of the expectancy of urticaria in adults, about 18 per cent of children who had therapy should have positive reactions. There was but 1 child who showed penicillin sensitivity. The forty-eight hour test should be employed to gage the potentiality of reaction in all persons about to receive therapy who have a history of a fungous disease or who present significant fungous infection. Elective therapy should be delayed until the patient is desensitized, or else therapy should proceed with caution. Value lies in utilization of the drug during desensitization of persons who have a severe penicillin reaction. Desensitization should be carried out in the hospital, although oral desensitization apparently can be done outside the hospital. Dermatologists should apprise members of the medical profession of the dangerous potentialities of the many reactions. The dermatophytids, and possibly a generalized exfoliating dermatitis, might be prevented by employing this forty-eight hour test. I believe also in warning against shifting the type of penicillin therapy, except in case of extreme necessity and with all safeguards, when any of these dermatologic signs are present. Reactions are apparently decreasing since the shift to the use of crystalline penicillin was made. Since crystalline penicillin *per se* can sensitize persons, there may be an increase in positive reactors as the therapy proceeds, just as with sulfonamide therapy. When the antihistamine drugs and calcium gluconate fail, as they often

do, one should not hesitate to give procaine hydrochloride intravenously, but, of course, cautiously and only after a preliminary test. One's control in this administration is extremely delicate.

DR. HARRY M. ROBINSON, Baltimore: Dr. Peck and his associates have discussed the relation of the patch test and the intradermal test, principally the latter, to penicillin reactions. I should like to attack that problem by the hind-before method; that is, we discuss the inadvisability of using penicillin as a topical application, but no one warns the nurse or the pharmacist about protection against reactions occurring in preparation of the penicillin. Two of our nurses, which is a small number among the many nurses in our hospital who prepare this drug, had a serious dermatitis from preparing penicillin. If they had a disease requiring the administration of penicillin, I am afraid their reactions would be serious.

DR. LEON GOLDMAN, Cincinnati: I am sorry that Dr. Peck could not discuss the eczematoid contact phase because, as the other speakers have indicated, it is much more important for the dermatologist, and it also is, perhaps, a "cleaner" method of analysis than the intradermal test, for the patch test is easier to use and interpret. I should like to know how many of Dr. Peck's patients, especially those with the erythematovesicular phase, had eczematoid contact sensitivity, either potential or actual. Do his remarks about children and their fungous infections refer also to children who have had trichophytids associated with fungous infection of the scalp? I should like to ask whether any synthetic penicillin has been available for cutaneous testing, and whether it would help to clear up some of these problems. Of course, the difficulty for the practicing physician, as Dr. R. L. Kile mentioned the other day, is that he cannot wait until the tuberculin type of reaction becomes evident; he is asked for an opinion when penicillin is needed as an emergency measure. If the immediate erythema-edema reaction could be developed to be specific, it would be of great practical value.

DR. E. E. MANDEL, Chicago: Permit me to relate briefly the apparently unique case of a girl $3\frac{1}{2}$ years of age in whom a systemic sensitivity reaction developed more than three weeks after the administration of penicillin in oil and wax, which constituted her first contact with this antibiotic substance. She had received 150,000 units of the Romansky preparation daily for three days because of a severe infection of the upper respiratory tract. Recovery was prompt. About one week after the first injection, painful infiltrated lesions at the sites of the injections developed, which subsided slowly. Twenty-two days after the last injection of penicillin in oil and wax, an acute illness set in, characterized by urticaria, adenopathy and fever, and eosinophilia (24 per cent), with a total white cell count of 10,000 per cubic millimeter and a fairly normal red cell count. After six days of severe malaise and itching, this illness gradually subsided. It was undoubtedly severer and lasted longer than the original disease for which the child had received penicillin. Two months later, she was subjected to scratch tests with white wax U. S. P. and peanut oil supplied by the company which had manufactured the penicillin preparation she had received. She was given scratch tests with that same penicillin preparation and with an aqueous solution of 15,000 units of penicillin per cubic centimeter; she was also tested with this solution intradermally. No reaction was observed. Nevertheless, there can be little doubt that the allergic disease as described was a response to the medication. The child had never before shown any sign of allergy, nor did she receive, either during or preceding that episode any other medication, except for acetylsalicylic acid and diphenhydramine hydrochloride, both of which afforded some relief. A thorough search of the pertinent literature revealed only 1 case of penicillin sensitivity; it was first noticed about twenty days after the last administration of the drug. The patient was an adult and an aqueous solution of penicillin was used (Kolodny, M. H., and Denhoff, E.: Reactions in Penicillin Therapy, *J. A. M. A.* 130: 1058 [April 20] 1946). Administration of penicillin in oil and wax is followed by untoward reactions so frequently in pediatric experience that some pediatricians refuse to employ it. No other case of such delay in the systemic reaction however, has come

to my attention. Systemic sensitization may have developed here at the time of the local reaction over the sites of injections.

DR. MARION B. SULZBERGER, New York: Any one who has been privileged to study and to participate in the work on the immunology of fungi and their extracts must come to the realization that the advances which have been made were in the main due to studies by dermatologists. It is, therefore, comprehensible that dermatologists again have led to the better understanding of the immunology of penicillin reactions. These recent advances are all based on earlier studies with allergenic fungi and logically come from that group of investigators which best understands the methods and the problems of fungous immunology—in other words, from the dermatologic immunologists. The mechanism of these untoward reactions to penicillin has been largely elucidated by the studies of well trained dermatimmunologists, as represented by the capable Dr. Peck and his group. All down the line the resemblance between trichophyton hypersensitivity and its manifestations and penicillin hypersensitivity and its manifestations is almost uncanny. The pictures can be transposed or superimposed without one's being able to distinguish between them so far as the type of cutaneous reaction is concerned. The untoward manifestations which penicillin causes, the *erythema-multiforme-like reactions*, the *urticarias*, the *morbilliform reactions*, the *fevers*, the *glandular swellings*, the *arthritides* and, most important, the *eczematous form of reaction* exemplified in the "id" type of response, have all long ago been carefully and well described in relation to pathogenic cutaneous fungi and recognized as due to trichophyton hypersensitivity. Moreover, the fact that immediate urticarial reactions are rare with penicillin provides another resemblance to the trichophyton test. There, too, with the exception of certain species of fungi (*Trichophyton purpureum*), as Dr. George M. Lewis and his co-workers have shown), the urticarial reaction is generally absent in cutaneous test, whereas the forty-eight to seventy-two hour delayed type and the *eczematous form of reactions* are commonly present. Now, Dr. Peck comes forward with another analogy. As Dr. Fred Wise and I were first able to show in 1932 (*Ringworm and Trichophyton: Newer Developments, Including Practical and Theoretical Considerations*, J. A. M. A. 99:1759 [Nov. 19] 1932), one can reduce the threshold of cutaneous sensitivity to the *eczematous or eczematoid type of trichophyton reactions* by repeated intracutaneous injections of trichophyton. Dr. Peck now shows for the first time that one can do that also with penicillin in the delayed type of penicillin cutaneous reactions. Another new fact emerges from this study, namely, the high incidence of cutaneous reactions to penicillin in men as compared with that in women.

DR. SHEPPARD SIEGAL, New York: I want to thank the discussants for their stimulating remarks concerning our paper. In reply to Dr. Goldman, we had just 3 instances of reaction in children, each of the urticarial type. He is correct in pointing out the practical difficulty of using a test which does not show a positive reaction until twenty-four or forty-eight hours later to a drug that often is needed immediately. We stress the value of the test when the patient has had a previous reaction and one wants to know whether he is still sensitive, or, for example, when one wishes to know beforehand whether the patient falls into the group with spontaneous sensitivity. When therapy must be started immediately, it might still be worth while to do the cutaneous test, for it may serve as a guide to reactions that may arise subsequently. I note Dr. Peck did not have time to mention one or two other things concerning spontaneous sensitivity and the delayed cutaneous reaction to penicillin. First, spontaneous sensitivity, apparently, lasts a long time. For example, we had at least 2 patients whom we tested after intervals of twelve and eighteen months, respectively, and they still had a strongly positive cutaneous reaction to penicillin. Desensitization, in some instances at least, is successful not only temporarily but over a long period. For example, 2 patients whom we desensitized were again tested several months later and were found to have a negative cutaneous reaction. One of them was still able to take large doses of penicillin several months after we had successfully desensitized him. Here, again, I want to emphasize that I am talking about a patient with type 2 sensitivity with the erythematovesicular form of reaction.

We have seen some severe reactions following administration of penicillin in oil and wax, characterized chiefly by an intense local, almost cellulitic, response, with marked induration of the buttocks, often associated with fever and sometimes with urticaria. This form is probably related to the type 1 reactions we have described. It occurs after a delayed incubation period, and often without an associated positive cutaneous reaction to penicillin, whether of the delayed or the immediate type. Another point I should like to emphasize is that reactions occur whether the penicillin is given orally, by inhalation or by injection. In 1 of our patients who had received penicillin by aerosol, a severe generalized urticaria developed about nine days after the inhalation therapy, while another patient responded promptly with a generalized erythematovesicular reaction, just as in patients after intramuscular injection.

STREPTOMYCIN IN TOPICAL THERAPY

I. Its Sensitizing Property

LEON GOLDMAN, M.D.
and
MILTON D. FELDMAN, M.D.
Cincinnati

Up to the present time streptomycin has not been used topically as extensively as penicillin, chiefly because of the limitations, expense and availability. Perhaps, also, the reactions from topically administered penicillin, after the initial enthusiasm, may be another factor in determining the reluctance to use streptomycin topically. In the field of dermatology, streptomycin has been used topically by Sulzberger and Baer,¹ Calloway² and Senturia and Broh-Kahn.³ There have been a few reports of the reactions from topically employed streptomycin. These reports have been infrequent also perhaps because of infrequent use. Nichols and Herrell⁴ indicated that contact dermatitis may result in those handling streptomycin. A case was reported by Feldman,⁵ in which an eczematous type of sensitivity was proved in patch tests to be due to the streptomycin. Strauss and Warring⁶ reported 4 cases of clinical epidermal sensitivity to streptomycin and 2 additional cases of subclinical but demonstrable sensitization proved by patch tests. These instances of sensitization occurred in a group of 12 nurses who came into contact with the drug while they were preparing solutions for administration to patients with tuberculosis.

In an effort to evaluate the actual and potential sensitizing qualities of streptomycin, a series of testing techniques were used. Patients were subjected to patch tests to streptomycin ointment of 5,000 units per gram in a cream base. The ointment was considered stable at room temperature for several weeks. A number of these patients were given repeat tests in two weeks. Of the first series, 48 were Negro, and of the second series 20 were Negro. Eight patients of the first series had received parenteral streptomycin therapy.

In an effort also to duplicate the conditions under which penicillin was studied, a certain number of

Dr. Feldman is a Bristol Fellow in Antibiotics. The streptomycin ointment was furnished by Bristol Laboratories, Inc. From the Department of Dermatology and Syphilology of the College of Medicine of the University of Cincinnati.

mucous membrane tests were done, both of the buccal mucosa and the vaginal mucosa. The vaginal mucosa tests were done because of the investigative work on the use of suppositories containing penicillin by Goldman and Feldman.⁷

Because of previous work with the artificial induction of penicillin dermatitis on the face, some experiments were done in a similar manner with streptomycin.

From these preliminary investigative studies of a small series of patients, it appears that streptomycin is a poor sensitizing agent and perhaps much less active than penicillin.

Does clinical experience bear out these investigative studies? In our series of almost 300 patients treated with streptomycin ointment, there have been 3 cases of eczematous contact hypersensitivity proved by patch tests. The condition was suspected in an additional case, but patch tests were not done.

REPORT OF CASES

CASE 1.—An elderly white woman was hospitalized because of stasis dermatitis on which was superimposed secondarily infected erosions and ulcerations. She was treated with streptomycin ointment dressings daily and showed initial improvement. However, on about the twelfth day of treatment, there appeared severe eczematoid dermatitis on the cutaneous areas where the ointment had been used. Reactions to patch tests with both streptomycin ointment and solution were strongly positive.

CASE 2.—A young white man was seen in the hospital because of chancroid pyoderma affecting the arm. Previous treatment, consisting of compresses and application of ammoniated mercury ointment, were of no avail, and streptomycin ointment was prescribed. When this had been used about four or five days, there appeared acute erythematous, edematous and vesicular dermatitis about the margin of the ulcer. Streptomycin therapy was discontinued, and patch tests were performed. The reactions were strongly positive to both streptomycin oint-

ment and streptomycin solution. Reactions to patch tests with penicillin were also positive; however, the drug was later given parenterally without reaction. The penicillin contact tests were not repeated.

CASE 3.—A middle-aged white woman with otitis externa was treated with streptomycin ointment. After a short while the dermatitis flared, and the skin of the eyelids, genitalia, arms and buttocks was involved with contact dermatitis. Reactions to patch tests with streptomycin were strongly positive.

Therefore, there are 3 proved cases in a total of almost 300. As topical streptomycin therapy is con-

tinued for longer periods of time, it is probable that more cases will be found.

An additional case which is not included in this series was that of a nurse in whom severe generalized dermatitis developed from streptomycin administered to patients. Her course was prolonged, and attempts at hypsensitization were difficult, for as little as 10 units would give a focal reaction also.

COMMENT

To date, streptomycin ointment has been observed to be of value in superficial infections with organisms which are sensitive to the drug. These types of infections include, of course, impetigo, pustular folliculitis, ecthyma and nonfungous external otitis. In general, the principles of topical streptomycin therapy parallel those for topical penicillin therapy as detailed by Goldman, Suskind and Friend.⁸

If it is established that streptomycin administered topically is less sensitizing than penicillin administered topically, then streptomycin would be preferred when topical therapy with antibiotics is desired. Moreover, the chances are certainly less of subsequent parenteral use of streptomycin than of penicillin. Tyrothricin, used topically, in our opinion, is a much less active antibiotic. This, too, can occasionally produce local reactions.⁹ Certainly, more comparative and critical trials of the various antibiotics, the older and tried and the newer chemotherapeutic agents for the topical therapy of superficial infections of the skin, are needed.

CONCLUSIONS

Results of preliminary investigative work from clinical trial, patch tests and tests of the buccal and vaginal mucosa, indicate that topically administered streptomycin is a sensitizing agent and that it is perhaps less sensitizing than topically administered penicillin. Three proved cases of eczematous hypersensitivity to topical streptomycin and one case of severe dermatitis in a nurse are reported from our clinical series. The frequency and severity of this type of reaction to streptomycin will be determined by greater experience.

Preliminary clinical investigative studies in almost 300 cases indicate that stable ointment preparations of streptomycin are effective in the treatment of superficial pyogenic infections.

HUMAN PARABIOTIC PYGOPAGUS TWINS WITH HYPERTENSION

Report of a Case with Clinical, Psychologic and
Endocrinologic Observations

STEWART H. JONES, M.D.

OMAR Z. YOUNGHUSBAND, M.D.

and

JAMES A. EVANS, M.D.

Boston

Pygopagy, the state of twins being conjoined at the sacrum, has been reported in human beings on an average of three times a century since 1100 A.D.¹ Nature thus provides a rare occasion for studying humoral influences, transmitted from one twin to the other through communicating circulations. Observations are feasible on the humoral transmission of substances influencing the emotional state, of glandular secretions and of disease in situations where one of the twins is afflicted. Margaret and Mary provided a unique situation, for Margaret had grade 2 hypertension, while Mary had labile hypertension, normal at rest. Margaret also had bladder calculi and a uterine leiomyoma. The rarity of observations on human conjoined twins, the anatomic and physiologic knowledge acquired from such a study and the significance of our observations relative to the similarity or dissimilarity of pygopagus twins have prompted us to write this report.

REPORT OF A CASE

Margaret and Mary, aged 34 years, conjoined at the sacrum, entered the New England Deaconess Hospital Dec. 3, 1946. Mary (right in figure 1A, left in figure 1B) was asymptomatic, while Margaret had hypertension, which had been discovered first five months previously, and complained of urinary frequency, which had been present intermittently for years, and pain in the lower part of the abdomen, which was mild, constant and not related to bowel, urinary or menstrual functions.

At birth, the twins' combined weight was 7 pounds (about 3,175 Gm.). Delivery was uncomplicated, but two months pre-

Fig. 1.—A, anterior view of the pygopagus twins, with Mary on the left and Margaret on the right. B, posterior view.

mature according to their mother. She denied having had any illness while carrying them, and her only other pregnancy resulted in a normal child ten years later. Details regarding the mechanism of labor or structure of the placenta were unobtainable.

At the age of 3 the twins entered the Boston Children's Hospital,² where operation to separate them was considered, but not done since it was found that their spinal canals communicated. At this time a "systolic blow" was detected in Margaret's heart. During childhood they had mumps, measles, pertussis and chickenpox at the same time. They were instructed by private tutors and, when older, traveled widely with circuses. At 21, Margaret's intravenous pyelogram showed renal calculi

Fig. 2.—Roentgenograms of the twin's juncture (Mary on the right and Margaret on the left).

on the right side. Two months later, at the Peter Bent Brigham Hospital,³ a cystoscopic examination with retrograde pyelograms showed no calculi, but demonstrated mild cystitis and narrowing of the urethra, requiring dilation. Margaret's blood pressure was 150 mm. systolic and 90 mm. diastolic, and Mary's was 150 mm. systolic and 94 mm. diastolic. The temperature charts made during both of these hospital sojourns, one in infancy and the other in adulthood, reveal identical curves in both sisters. Menarche and menstruation were similar in each as far as could be determined in view of the difficulty of telling which sister was menstruating, since there was practically a common vagina. Their mother stated that they started to menstruate at the age of 13 and that they have only one period a month, sometimes lasting four to five days and occasionally nine to ten days. Only Margaret has any menstrual discomfort, and this is mild.

The family history is not contributory except that their mother has hypertension with systolic pressure up to 240 mm. of mercury.

Their union resulted from fusion of anomalous sacral bones, as shown in figure 2, and of perineums, the surface anatomy of which appears in figure 3. The urethras were located $\frac{1}{2}$ inch (about 1.3 cm.) apart; vaginal openings were barely separated by a thin septum, with the medial labia absent and the lateral set fused, and the anus was a single orifice. Roentgenologic studies after an enema with barium sulfate showed separate sigmoid colons entering the common rectum 3 inches (about 7.5 cm.) above the anus. A pelvic examination performed under anesthesia demonstrated separate uteri. Tests for cutaneous sensation in the immediate vicinity of the junction between them were perceived by both. In standing, Margaret's trunk inclined to the left and Mary's to the right. This position caused the outer arm and breast of each to hang in a more dependent position than its fellow and may account for the larger size of these outer appendages.

Margaret was thin, high strung and apprehensive, while her sister was stout, calm and placid. Their mother stated that they had always been different; Margaret was usually concerned about her health and finances, and Mary was easy going

2. Information was obtained through Dr. Charles Brugler, Superintendent of the Children's Hospital, Boston.

3. Information was obtained through Dr. Norbert Wilhelm, Superintendent of the Peter Bent Brigham Hospital, Boston.

The only other abnormal physical observations of note were a small leiomyoma of the uterus and grade 2 apical systolic murmur in Margaret and hypertension in both. No signs of a leiomyoma were observed clinically in Mary. Figure 4 is a chart of their blood pressure readings recorded by nurses every three hours for ten days and is representative of the behavior of their blood pressures during the entire period of hospitaliza-

The results of the following laboratory tests were normal and similar in each sister: urinalysis, blood cell counts, chemical determinations in the blood for sugar, nonprotein nitrogen, cholesterol, calcium, alkaline and acid phosphates, phosphorus and renin;⁴ results of serologic tests for syphilis, electrocardiograms, electroencephalograms and roentgenograms of the chest were also normal. Arm to tongue circulation time with triketocholanic acid ("decholin") was 15 seconds for Margaret and 8 for Mary.

Figure 1 consists of four line graphs. The top-left graph shows Blood Pressure (mm Hg) over 11 days (9 AM, 10 PM, 11 AM, 11 PM). The bottom-left graph shows Temperature (°C) over 7 days (13, 14, 15, 16, 17, 18, 19). The top-right graph shows ETAMON test results for Margaret (3 cc) and Mary (3 cc) over 7 minutes, with positions: Basal, Sitting, Standing, Lying. The bottom-right graph shows ETAMON test results for Margaret (3 cc) and Mary (3 cc) over 7 minutes, with positions: Basal, Sitting, Standing, Lying.

Tests for renal function showed impairment in Margaret, as is shown in the results summarized in the table. In performing the phenolsulfonphthalein test, urine samples were obtained by catheter from each bladder.

4. Reported by Dr. Lewis Dexter, Peter Bent Brigham Hospital, Boston.

After 30 cc. of iodopyracet injection was given intravenously to Margaret the renal calices were not visualized by roentgenogram, and the bladder showed only poor concentration of the dye, while Mary's calices and bladder on the right side were well visualized. Later the same amount of iodopyracet injection administered to Mary gave good visualization of Mary's bladder and barely outlined Margaret's bladder. Two calculi, approximately 2.5 cm. in diameter, were discovered in the latter's bladder. While Margaret, with the severer hypertension, had some impairment of her renal function, her urinary urea and sodium chloride estimations proved that she was not dependent on Mary's kidneys.

A cystoscopic examination by Dr. Howard Trafton revealed Margaret's urethra to be narrowed, and dilation was required. The bladder was mildly inflamed. The stones were removed by crushing and were observed to be composed of urates and oxalates.

Whether to attempt surgical separation of the twins was settled by their flat refusal even to consider this. They had become so adjusted to being joined together that separation was unthinkable. In their opinion this would be no less than amputation of a personal appendage. The members of the orthopedic and surgical departments agreed that surgical separation was not feasible, because insurmountable difficulties would be met in the lumbosacral region where the spinal canals were known to communicate. Probable damage to a common cauda equina would result in complications of the bowel and bladder of a serious nature. Furthermore, colostomy in one, and probably in both, would be necessary, because of the single rectum. Should one die, however, operation would be urgent to save the life of the other. The neurosurgical consultant expressed the belief that it would be possible to perform a splanchnicectomy on Margaret if such were indicated for relief of hypertension.

COMMENT

Evidence for intercommunication of the sisters' vascular systems was obtained from the simultaneous excretion from both of phenolsulfonphthalein and iodopyracet injection. The degree of this vascular exchange was not exactly determined, but appeared to be moderate in view of the concentration of dye materials in the opposite twin. Had tagged red blood cells been available, this could have been quantitated.

That factors other than humoral transmission predominate and that humoral influences play little or no part in mediating emotional states are brought out by the diametrically opposite temperaments and reactions of the twins. They both had similar environments. That one was tense, aggressive and worrisome and the other passive and phlegmatic would seem to depend on hereditary factors, such as caused one to be round faced and the other long faced.

Other pygopagi, as the Siamese twins and the Blazek sisters,⁵ also showed definite differences in physique and temperament, lending support to the hypothesis that they were derived from two ova and hence dissimilar twins rather than having originated from maldevelopment of a single ovum. On the other hand it is difficult to see why they become attached so symmetrically, as sacrum to sacrum rather than, say, sacrum to shoulder, if fusion results merely from proximity in utero of the two fetuses, or why such twins always have the same sex unless they arise from a single ovum. The pathogenesis remains unknown and awaits further observation. More details regarding placentas are especially important since such information is lacking in most reported cases.

That menstruation began in both at the same age and continued to occur practically simultaneously

requires explanation, for at first glance it would be expected that, since each had a pituitary gland, there would be different menstrual cycles at one time or another. The self-regulatory effect of ovarian hormones acting on the pituitary gland, however, may explain this menstrual similarity. Follicular stimulating hormone causes production of estrogen, which in turn inhibits further follicular stimulating hormone secretion, while stimulating secretion of pituitary luteinizing hormone. The latter causes outpouring of progesterone from the corpora lutea, which in turn inhibits further luteinizing hormone production, but also apparently stimulates secretion of follicular stimulating hormone. Because of intercommunicating circulations between the twins, each of their pituitary glands is under the control of this system, so that they probably behave as if only a single mass of pituitary tissue were present.⁶

Should one of the sisters require bilateral oophorectomy or have natural menopause before the other, the situation would resemble that of parabiotic rats when one is castrated and the other left intact. Under the stimulus of castration the pituitary gland of the castrated animal hypersecreted and the excessive gonadotropic hormones stimulate the ovaries of the intact animal to increased estrogen production, causing continuous estrus and adrenal hyperplasia in the intact animal. If estradiol is given to the castrated animal, the gonadotropic secretion of the pituitary gland is inhibited, so that excessive estrogen is not produced.⁷

In a report on another set of pygopus twins,⁸ when one became pregnant both developed increased pigmentation, and both lactated, the aunt more than the mother, indicating exchange of pituitary hormones.

The presence of a leiomyoma in Margaret and not in Mary does not necessarily prove or disprove that ovarian hormones are causal, for it is likely that the concentration of hormones in each is different. The interchange of ovarian secretions between the twins is not as simple as the exchange of dyes, for ovarian substances are apparently rapidly removed from the blood stream, especially by the liver. Furthermore it is likely that there are differences in sensitivity of end organs and in the presence or absence of a leiomyoma anlage.

The similarity of Margaret's and Mary's temperature charts, not only during the present hospital sojourn, but also during hospitalization at ages 3 and 21, allows the conclusion that substances affecting temperature control are disseminated by way of the blood stream, at least during localized infections such as cystitis.

The close parallelism of the blood pressure curves has two possible explanations, either as humoral transmission of pressor substances affecting both twins quantitatively, or as identical responses to environmental influences. There was no evidence to favor one over the other. The absence of crossed effect from the cold pressor test was expected with this test, as vasomotor reflexes rather than chemical changes are responsible for changes in blood pressure and the twins had no demonstrable intercommunication of autonomic nerves. In the mecholyl and sodium isoamylethylbarbiturate tests, lack of crossed effect is best explained by such rapid removal of the drugs from the blood that little or none reached the other twin. The greater effect of

tetraethyl ammonium chloride on Margaret, even when administered only to Mary, indicates increased vaso-motor tone of the more hypertensive sister.

In physiologic experiments⁸ when 1 of 2 parabiotic rats is rendered hypertensive, the co-twin may also have a rise in blood pressure, but fails to have an exactly identical increase and in some cases fails to have any rise. Presumably, there is a difference of concentration of "pressor" or "antipressor" substances between the 2, owing, possibly, to rapid removal of these substances from the circulation before they have a chance to pass from one to the other. Grollman and Rule⁸ observed that hypertension results from removal of two or three kidneys from parabiotic rats and concluded that deficiency of an "antipressor" generated by the kidneys is the cause of hypertension in these cases.

Several hypotheses are possible to explain the hypertension in our twins. It could well be hereditary, since their mother has elevated blood pressure, or it may be secondary to chronic renal infection, on the basis of Margaret's renal and vesical calculi and past history of pyuria, with "pressor" substances carried to both twins by way of the circulation, or from deficient production of "antipressor" substance by Margaret's diseased kidneys. The more exaggerated response to tetraethyl ammonium chloride by Margaret, the hyperkinetic twin, proves her vasomotor tonus and lends support to Selye's⁹ theory of psychic stimulation of the adrenals. Mary's blood pressure was of lesser degree because neither the psychic nor renal factors pertained in her case. It might be conjectured that Mary's milder hypertension was entirely due to a transport of "pressor" substances from her more hypertensive sister. While it is possible that Margaret had deficiency of "antipressor" substances from renal damage, there is no reason to suspect this in Mary, so that the presence of a "pressor" substance, which would be transmittable, is more likely than deficiency of "antipressor," which would not be transmissible. The demonstration of a small amount of renin in the blood of both twins supports the theory of a transport of a "pressor" substance from Margaret to Mary.

It is significant that the sister with the higher blood pressure was also the more hyperkinetic one and furnishes evidence for the presence of psychosomatic elements in hypertension.

SUMMARY AND CONCLUSIONS

Clinical observations on a hitherto unreported set of pygopus twins furnish grounds that such anomalies originate from two separate ova rather than, as frequently supposed, from a maldeveloped single ovum. There are data to confirm the transportation of female sex hormones by the blood stream and to show humoral transmission of temperature-elevating substances in fevers associated with infections. Emotional states appear not to be mediated by way of the circulation. The parallelism of their blood pressure curves suggests a humoral control, but may have been from similar response to environmental factors. Their hypertension appeared to be due to a combination of heredity, chronic renal infection, chronic anxiety and nervous tension factors, with renal and tension factors predominating in Margaret and hereditary and humoral factors in Mary.

SYMPTOMS MASKED OR MODIFIED BY CHEMOTHERAPY

The Increasing Responsibility of the Roentgenologist

VINCENT W. ARCHER, M.D.

GEORGE COOPER JR., M.D.

and

NORMAN ADAIR, M.D.

Charlottesville, Va.

In a recent ward round, the Chief of the Surgical Service of the University of Virginia Hospital remarked, "Since the advent of chemotherapy, the sections of textbooks dealing with the diagnosis of infection must be rewritten." With the widespread use of chemotherapy in any illness remotely suggesting infection, few patients fail to receive one of the newer chemotherapeutic remedies. It is the almost universal experience of physicians in the larger reference institutions that an increasing number of patients are seen in whom the classical symptoms of disease are masked or modified by previous chemotherapy. The correct diagnosis of disease, or the proper evaluation of progression or regression of pathologic processes, even after the diagnosis has been established, has become much more difficult. The roentgenologist, therefore, since he interprets pathologic changes as depicted on his films, must assume more and more responsibility with respect to the proper treatment of the patient, disregarding in large part, classical symptomatology.

Several reports dealing with single cases of infection or of one or more diseases, with masked symptoms have appeared in the recent literature. Labby¹ reported a case of recurrent pneumococcal meningitis following treatment with sulfonamide compounds. Weinstein and Atherton² reported sinus phlebitis occurring during treatment of acute suppurative otitis media with no clinical signs of mastoiditis. Riley³ as quoted by Rothman, reported a case of acute appendicitis treated by full sulfadiazine dose for seventy-six hours at sea with complete masking of symptoms, with acute appendicitis at operation. Rothman⁴ summarized the literature through 1945, stressing the recurrence of symptoms following cessation of chemotherapy. Christie and Wyatt⁵ in 1946 stressed the changes in roentgenologic diagnostic criteria, presenting several cases of osteomyelitis and 1 of perinephritic abscess.

During the past few years the members of the Department of Roentgenology of the University of Virginia Hospital have been impressed by the increasing number of patients with diagnostic difficulties following chemotherapy, in whom the symptoms did not fit in with the roentgen findings. This has been particularly true in surgical complications resulting from pneumonia. Abscess of the lung and infected bronchiectasis offer many such difficulties, and it is our impression that there is a definite increase in these complications following chemotherapy. Possibly this may be explained

by the relative lack of liquefaction of bronchial secretion as demonstrated in experimental animals.⁶

Without resort to statistical data, illustrative cases of varied conditions are presented, with symptoms and signs at variance with the roentgenologic and operative findings.

REPORT OF CASES

CASE 1.—For ten months, M. F., a woman aged 70 years, had intermittent attacks of fever and abdominal cramps, accompanied by a watery diarrhea with mucus and traces of fresh blood. A barium enema revealed an obstruction in the sigmoid colon, with diverticula proximal to the obstruction. When she was treated for diverticulitis by colonic rest, the obstruction was quickly relieved. A five day course of sulfadiazine resulted in complete disappearance of fever, diarrhea and discomfort. Two weeks after discontinuance of the drug, symptoms returned in more severe form. Again, a barium enema demonstrated pronounced diverticulitis, and again sulfadiazine produced relief.

Fig. 1 (case 1).—Carcinoma of the sigmoid, discovery of which was delayed by response to sulfadiazine therapy of an earlier demonstrated sigmoid diverticulitis.

Subsequent episodes in the next two months did not respond so well and a pelvic mass was discovered. Barium enema then (fig. 1) showed a tumor of the sigmoid colon as well as diverticulitis. At laparotomy, a large cancer of the sigmoid colon was found, invading the bladder.

Comment.—In this case, the response of diverticulitis of the sigmoid colon to sulfadiazine delayed discovery of a carcinoma of the sigmoid colon.

CASE 2.—D. R. V., one of a pair of premature twins, had omphalitis and an infection of the blood stream with *Staphylococcus aureus* in its second week of life. With penicillin, the omphalitis promptly cleared up and in ten days blood cultures were negative, but penicillin was continued for another week. Ten days later, diarrhea developed. It was treated by Murphy drip and sulfadiazine. While sulfadiazine was being given, infection developed at the site of insertion of a bone marrow drip needle. Administration of penicillin was again started. The infection of the bone spread, a pathologic fracture occurred,

but healing was complete in six weeks (fig. 2 A). There was no sequestration and the maximum temperature was 100 F.; the white blood cell count was 21,000 when the diarrhea started and did not exceed 11,000 during the course of the osteomyelitis. The infant was discharged in excellent condition.

Fig. 2.—A (case 2), osteomyelitis of the tibia, involving entire shaft and complicated by a pathologic fracture. There was complete healing in six weeks under penicillin therapy. B (case 3), osteomyelitis of the radius treated with penicillin, six months after onset of disease. The failure of healing and sequestration were unsuspected clinically because of the absence of symptoms. True status determined by roentgenographic examination only.

Comment.—Osteomyelitis, complicating treatment of an ill, weak premature infant, healed in six weeks under penicillin therapy. Though the infection involved the entire shaft of a tibia and was itself complicated by a pathologic fracture, local and constitutional symptoms were minimal, and the bone did not sequestrate.

CASE 3.—W. F. W., a white boy aged 18, was admitted after he had received penicillin for three weeks for osteomyelitis of the radius. Excruciating pain had been relieved, but the

Fig. 3 (case 4).—Osteomyelitis of the tibia, symptoms controlled by penicillin but infection still spreading.

forearm was still tender, swollen and hot. The temperature was 101 F., and the white blood cell count 12,500. On the day of admission, the central abscess was unroofed, releasing a large amount of thick, white pus. Penicillin was continued

6. Jackson, C. L., Jr.: Personal communication to the authors.

and sulfadiazine started. Local and constitutional symptoms promptly disappeared. Five weeks later (fig. 2B), healing had begun but sequestrums had developed. It was nearly six months before he could be given a hospital bed for sequestrectomy. During this time, there was persistent drainage, but no discomfort or fever.

Comment.—During treatment for osteomyelitis by penicillin, it is more important than ever to follow the course of the infection by roentgen rays. The clinical picture is frequently completely misleading.

CASE 4.—After ten days of pain in the upper part of the tibia accompanied by limping, fever, localized hyperemia and swelling, roentgenograms of R. R., a white boy aged 8, revealed a slight amount of destruction of bone in the anterior tibial cortex just distal to the upper epiphyseal line. Penicillin was administered for two weeks. In one week, local and constitutional symptoms had disappeared. Roentgenograms showed no change. Penicillin was discontinued. Two weeks later, local symptoms reappeared. Roentgenograms (fig. 3A) now showed definite progress of the osteomyelitis. Penicillin again produced rapid clinical improvement, but check roentgenograms (fig. 3B) seven weeks later showed the infection to have spread still further.

Comment.—The infection might have been completely arrested by more prolonged treatment. When it flared up, penicillin could control the clinical symptoms but not the spread of the infection.

Fig. 4 (case 5).—Fibrosarcoma of the femur, the biopsy diagnosis of which was delayed because the clinical response to penicillin was that of Brodie's abscess.

CASE 5.—G. S., a woman aged 31 years, had suffered intermittent pain in the left knee for five years. On examination, the knee was found to be partially ankylosed, tender, moderately swollen, slightly hot and slightly reddened. The temperature was 99 F., the white blood cell count 8,400. Roentgen examination (fig. 4) showed central bone destruction with perforation

of the cortex in the condylar region. Biopsy was advised to differentiate between Brodie's abscess and an atypical tumor of the bone.

Penicillin was given preoperatively. In forty-eight hours, all pain had disappeared and articular motion was partially restored. The patient then refused biopsy. Penicillin was given for two

Fig. 5 (case 6).—Large left perinephritis abscess, demonstrated by lateral displacement of the left kidney on intravenous pyelography. Penicillin had obscured clinical evidence of the infection.

weeks, during which time roentgenograms showed increased destruction of bone, and the roentgenologists again urged biopsy. The surgeons were willing but not enthusiastic, feeling that the clinical course indicated Brodie's abscess, and the patient flatly refused. When penicillin was stopped, pain recurred. Roentgenograms showed progressive destruction of bone. Exploration revealed a tumor. The pathologic report was highly malignant fibrosarcoma.

Comment.—Penicillin caused a fibrosarcoma to follow the clinical course of Brodie's abscess. Sufficient importance was not attached to the fact that destruction of bone progressed steadily, in spite of the clinical improvement.⁷

CASE 6.—S. W. B., a boy aged 18 years, was admitted with a history of pain in the left flank of fifteen days' duration, for which he had received penicillin with partial relief of pain.

On admission, the left flank was moderately full and tender. The urine was normal, and the temperature normal. Penicillin was continued for another week with slow disappearance of the pain and fulness in the left flank. Pain suddenly developed in the lower left part of the chest; the white blood cell count jumped from 10,000 to 25,000, and roentgenograms of the chest revealed a left pleural effusion. Large amounts of bloody fluid containing staphylococci were removed in the next two days. Pyelograms were then obtained by the intravenous method, demonstrating a lateral displacement of the left kidney (fig. 5). The next day, the region of the left kidney was

7. While demonstrating a scientific exhibit on the subject of this paper at the Atlantic City meeting of the American Medical Association one of us (V. W. A.) was told by eleven different physicians that they had had single cases of bone tumors in which the pain has been greatly relieved during treatment with penicillin, an indication that this case of ours may not be uncommon.

explored, releasing a large amount of thick pus from the perinephritic space. The chest fluid promptly became sterile. Pleural thickening necessitated decortication three weeks later, after which convalescence was uneventful.

Comment.—Penicillin obscured the progress of a perinephritic abscess, delaying drainage until empyema developed.

CASE 7.—P. P., a girl aged 19 years, had a tonsillectomy under ether anesthesia. Two weeks later, fever, cough and foul sputum developed. An abscess in the upper lobe of the right lung was demonstrated by roentgen ray. During a course of penicillin, the abscess disappeared, leaving only fibrous scarring. Two weeks after the penicillin was discontinued, all symptoms returned. Roentgenograms now showed pneumonitis at the site of the abscess. For the next six months, symptoms were intermittent and were easily controlled promptly by penicillin. Roentgenograms (fig. 6) showed dense infiltration. (Note the cavity on the Bucky plate.) At operation, a dense, hard area, suggestive of cancer, was found in the anterior half of the upper lobe of the right lung. The pathologist reported subacute bronchiectasis and an abscess 1.5 cm. in diameter.

Comment.—This is one of a number of cases which we have seen in which penicillin has discouraged but not cured a lung abscess, leading to the development of a stony hard area of subacute bronchiectasis.

CASE 8.—W. E. McC., a man aged 34 years, had lobar pneumonia, from which he recovered promptly, being treated with sulfadiazine. Three weeks later, fever and productive cough returned. On roentgen examination, "a spot on the lung" was discovered. After four weeks of treatment with penicillin and sulfonamide drugs, he was well for four months. Fever and cough recurred; the sputum was foul and copious; there was a rapid loss of weight and strength, and a roentgenogram showed "the spot on the lung" to be larger.

Fig. 6 (case 7).—End result of a postanesthesia abscess of the upper lobe of the right lung treated by penicillin. Lobectomy was necessary.

Admission to a state tuberculosis sanatorium was sought and obtained. During a two months' stay there, repeated sputum examinations were negative for tubercle bacilli, the patient continued to lose strength, and it was noted that clubbed fingers developed. He was then transferred to the University Hospital.

Roentgenograms of the chest, on admission (fig. 7), showed a dense opacity in the upper lobe of the right lung. On

bronchoscopy, inflammation of the bronchus of this upper lobe was observed and a small amount of purulent sputum was seen coming from it. The abscess was drained in two stages. At the second operation, a large amount of thick yellow pus and some necrotic tissue were evacuated. Penicillin was given

Fig. 7 (case 8).—End result of a postpneumonia abscess of the upper lobe of the right lung treated by sulfonamide drugs and penicillin. Two stage drainage was necessary.

throughout the hospital stay. The white blood cell count never exceeded 14,000, and there was only a low grade fever. Recovery was uneventful.

Comment.—Sulfonamide drugs and penicillin obscured the clinical picture in a postpneumonia abscess of the lung to such an extent that the patient was placed in a tuberculosis sanatorium. Correct diagnosis and proper treatment were deferred for months.

CASE 9.—I. J., a man aged 57 years, had pneumonia of the lower lobe of the right lung, complicated by a pleural effusion, which was treated with penicillin and sulfadiazine. All cultures from the chest fluid were negative. The fluid gradually decreased, the pneumonia slowly resolved, and after one week of normal temperature he was discharged. He returned ten days later, stating that a dull pain had developed in the base of the right lung as soon as he got home (within twenty-four hours after discontinuance of penicillin and sulfadiazine); that he had felt weak and feverish, and had had one night sweat. Roentgenograms showed more fluid in the base of the right lung. Thick, greenish pus was obtained by chest tap from which anaerobic hemolytic and nonhemolytic streptococci were cultured. Penicillin and sulfadiazine were again administered. The response was poor, and a week later the empyema cavity was decorticated. Recovery was rapid.

Comment.—Penicillin and sulfadiazine delayed but did not prevent development of empyema complicating lobar pneumonia. More prolonged treatment might have been beneficial.

CASE 10.—Treated for pneumonia with a sulfonamide drug, O. F. H., a man aged 53 years, responded favorably, but after he had been afebrile for one week his sputum became more copious and foul. He lost strength and had a number of chills and more fever. After three weeks of poor response to a sulfon-

amide drug, he was referred to the University Hospital. Roentgenograms showed pocketed fluid well forward in the left side of the chest and close to the mediastinum. At operation, thick pus drained from the cavity and a bronchial fistula was found. It was not clear whether this was an empyema or abscess cavity. Recovery was good.

Comment.—A sulfonamide drug attenuated an empyema (or lung abscess) enough to delay surgical treatment several weeks.

CASE 11.—S. S., a woman aged 40 years, was admitted in an attack of acute cholecystitis. Placed on a regimen of nothing by mouth, intravenous fluids and penicillin, she was completely asymptomatic within three days. She was gradually built up to a regular diet and prepared for surgical treatment. A cholecystogram revealed a nonfunctioning gallbladder. Cholecystectomy was done on the seventeenth hospital day. The gallbladder wall was thick and indurated, the gallbladder filled with stones and purulent exudate.

Comment.—The clinical picture of acute cholecystitis was abruptly obscured by penicillin. For two weeks, a severely diseased gallbladder was kept completely silent.

CASE 12.—Five days before admission, a woman aged 28 years experienced severe pain in the left ear, followed in a few hours by purulent drainage. On admission, the left ear was draining copiously, there was tenderness behind it, and the temperature was 103 F. Roentgenograms showed a hazy left mastoid without cell destruction. Penicillin was started at once. Forty-eight hours later, there was no fever, no tenderness, and discharge had almost ceased, but the canal was sagging. A week later, the ear again became painful, and after myringotomy discharge was profuse. Roentgenograms showed the left mastoid to be considerably hazier, but still no cell destruction was demonstrated. At mastoidectomy, all cells were found to be filled with gelatinous, agglutinated pus.

Comment.—This is one of a number of cases of mastoiditis in which penicillin restrained but did not

Two weeks later, while the patient was still on penicillin, a swelling suddenly appeared above the left zygoma. Though the left drum was bulging and roentgenograms showed a hazy mastoid without destruction of bone, the temperature was 99.2 F. At operation, the mastoid structures were soft and filled with granulations.

Fig. 9 (case 14).—Same patient as in figure 8, after drainage of the right subphrenic abscess. A large subhepatic abscess of the left upper quadrant was demonstrated roentgenologically by the displacement of the stomach, but was not recognizable by physical signs or clinical symptoms during penicillin therapy.

Comment.—Treatment of acute sinusitis with penicillin completely masked acute mastoiditis.

CASE 14.—C. L. W., a man aged 30 years, had a sudden attack of violent epigastric pain. Hospitalized elsewhere with a tentative diagnosis of spider bite, he was, in addition to other measures, given penicillin. He slowly improved, and two weeks later was discharged, having had no temperature for a week. The night after discharge and discontinuance of the penicillin, he suffered a second attack of violent epigastric pain. Roentgenograms made elsewhere (fig. 8) showed a large right subphrenic air space.

The patient was admitted to the University Hospital; penicillin was again started and continued throughout the hospital stay. The right subphrenic space was drained, releasing a large amount of gas and foul, thin pus. Drains were brought out through the incision and a five day course of streptomycin given. Nevertheless, the temperature curve continued septic. Roentgenograms two weeks later showed air still present under the right diaphragm, both diaphragms fixed, and a little fluid in the base of the left lung. The surgeon elected first to reexplore the right subdiaphragmatic space. No pus pockets were found. Then barium studies of the stomach were done (fig. 9), showing the stomach shifted to the left and downward. Through an upper midline incision, a large subhepatic abscess in the left upper quadrant was drained. Postoperative studies showed the stomach back in normal position.

Comment.—Here penicillin obscured the clinical diagnosis of a right subdiaphragmatic and left subhepatic abscess. The roentgen observations were diagnostic.

SUMMARY

Symptoms were markedly altered by chemotherapy in the following conditions: (1) diverticulitis with cancer, (2) fibrosarcoma, (3) perinephritic abscess,

Fig. 8 (case 14).—Large right subphrenic abscess, the symptoms of which were obscured by penicillin therapy.

cure the infection. Frequently, the cell walls remain intact; they usually are found to contain gelatinous, agglutinated pus.

CASE 13.—J. C. McC., a boy aged 8 years, had acute sinusitis and a painful ear. During treatment with penicillin the pain in the ear disappeared so quickly that it was forgotten, treatment being directed to relief of the severe sinus infection.

(4) lung abscess, (5) acute cholecystitis, (6) mastoiditis, (7) subphrenic and subhepatic abscess, (8) empyema and (9) osteomyelitis.

The roentgenologist must accept an increasingly large share of the responsibility for correct evaluation of progression or regression of pathologic processes due to infection when treated by chemotherapy.

ABSTRACT OF DISCUSSION

DR. GEORGE M. WYATT, Washington, D. C.: I have been interested in osteomyelitis as altered by penicillin and the sulfonamide drugs. In regard to the case that Dr. Archer showed of an acute condition which was thought to be osteomyelitis, I should like to add a word or warning on the other side, as probably all of you have seen cases in which the pathologists found it difficult to differentiate between malignant and benign tumors and callus. This is particularly true in children when attempts are made to get a quick diagnosis. From the few cases with which I have personally come in contact, in which extremities have been removed with a mistaken diagnosis of cancer, I wonder whether perhaps more extremities have not been removed with the mistaken diagnosis than malignant tumors cured by amputation. The roentgen diagnosis, as Dr. Archer has stressed, is based on pathologic changes. If we continue to study pathologic changes as we see them on the roentgenogram and keep in mind the effect of chemotherapy on pathologic changes, we can help the clinician.

Council on Physical Medicine

The Council on Physical Medicine on the advice of the Consultants on Audiometers and Hearing Aids has adopted the following article. The Consultants on Audiometers and Hearing Aids are: Drs. Gordon Berry, Hallowell Davis, Kenneth M. Day, Edmund Prince Fowler, Isaac H. Jones, Dean Lierle, Moses H. Lurie, Douglas Macfarlan, C. Stewart Nash and Paul E. Sabine. The Council appreciates the cooperation of the Consultants on Audiometers and Hearing Aids.

HOWARD A. CARTER, Secretary.

REBATES

The House of Delegates of the American Medical Association has taken a definite stand against the acceptance by physicians of rebates or "kick-backs" in any form. A physician dispenses medical or surgical service and for this he is entitled to a fair recompense. When he, himself, furnishes drugs, spectacles or any physical appliance and when he is able to service such physical appliances, he is entitled to a fair profit on these articles of merchandise in addition to and above his own professional fee and such a profit on such articles of merchandise does not in any way constitute a rebate or "kick-back." However, when he prescribes such an article for his patient and the patient purchases the article from an independent dealer the doctor is not morally or ethically entitled to any financial return from the dealer.

It has come to the attention of the Consultants on Audiometers and Hearing Aids of the Council on Physical Medicine of the American Medical Association that physicians in various parts of the country are being offered, and that some have accepted, money from dealers for recommending particular makes of hearing aids. Such a transaction between the doctor and the dispenser of hearing aids constitutes a rebate and is in direct contravention of the stand of the American Medical Association in this matter. It is degrading to the profession and commercializes the doctor who

accepts such a "kick-back." It is not believed by the Council on Physical Medicine that such a policy is encouraged by the manufacturers of hearing aids, but the manufacturer cannot always control the business ethics of his individual dealers.

A modified form of "kick-back" is a recent suggestion that a hearing aid dealer would sell only to patients whose ears had been examined by an otologist. The doctor's fee according to this arrangement would be paid by the hearing aid dealer. Presumably the cost would be passed on ultimately to the patient in the form of a higher price for his instrument. Such an arrangement is disapproved by the Consultants, since it involves a payment from dealer to physician that might be interpreted or used as a "kick-back." To be beyond criticism in such a situation, the payment to the doctor should be made by the patient himself, not by the dealer.

The Council on Physical Medicine believes that these practices constitute the acceptance of a rebate on the part of the profession and that every possible step should be taken to abate it.

The Council on Physical Medicine has authorized publication of the following reports. HOWARD A. CARTER, Secretary.

OTARION HEARING AID MODEL E-1S ACCEPTABLE

Manufacturer: Otation Hearing Aids, 159 North Dearborn Street, Chicago 1.

This instrument is a three tube air conduction hearing aid, with the batteries contained in the amplifier case. The case is constructed of die-cast magnesium alloy, coated with vinyl resin finish, ivory in color. A side-hinged full length back cover gives access to the battery compartments and the three tubes, which are readily accessible. The magnetic type receiver is connected to the amplifier case by means of a light plastic-covered cord which has dual pin plugs at each end.

Two wheel-type controls are placed at the top of the case. One is a volume control; the other is a combination "on-off" switch and tone control with three tone settings: 1 dot, full tone range; 2 dots, slight low frequency attenuation, 3 dots, greater low frequency attenuation. A detachable wearing or attachment clip fastens either to the front or the back of the case.

The dimensions are 133 by 64 by 22 mm. (5¼ by 2½ by ¾ inches) and the weight with the batteries is 213 Gm. (7½ ounces). The A battery of the zinc and carbon type is 1.5 volts and the B battery of the zinc and carbon type is 30 volts. The A battery drain is 55 milliamperes and the B battery is 0.36 milliamperes.

Acoustical Gain for Pure Tones

Tone Control Position...	250	500	1,000	2,000	3,000	4,000 cycles
Maximum gain, 1 dot...	30	31	34	40	41	30 db.
Maximum gain, 2 dots...	22	27	33	40	41	30 db.

These gain measurements for pure tones show the amplification efficiency of the hearing aid in decibels at the indicated frequency levels.

Acoustical Gain for Speech.—The maximum gain, with the tone control in the 1 dot position, was 34 decibels. This value for speech was obtained on 2 different hard of hearing persons, each of whom is an experienced user of hearing aids and has approximately 60 decibels unaided loss for speech with a speech audiometer. These 2 persons perceived speech with 34 decibels less intensity through a high quality sound amplification system (speech audiometer) in a sound-proof room with the hearing aid than without it.

Otation Hearing Aid Model E-1S

The Council believes that this instrument, the Otariion Model E-1S, will be satisfactory only for persons requiring moderate amplification and should not be recommended for persons with severe hearing impairments.

The Council on Physical Medicine voted to include the Otariion Hearing Aid Model E-1S in its list of accepted devices.

SYLVANIA 250 WATT R40 INFRA-RED LAMPS ACCEPTABLE

Manufacturer: Sylvania Electric Products, Inc., 60 Boston Street, Salem, Mass.

Two specimens of a 250 watt R40 infra-red lamp were submitted. These require a 120 volt alternating current and draw 208 amperes. They weigh 225 Gm. ($\frac{1}{2}$ pound) and measure about 13 cm. (5 inches) in diameter. They differ in length and in the material of the bulb; the ruby type measures about 18 cm. ($7\frac{1}{4}$ inches) while the frosted type measures about 16.5 cm. ($6\frac{1}{2}$ inches). Each lamp has an aluminum reflector and a tungsten filament operating at a color temperature of 2,400 degrees Kelvin.

On the basis of the available evidence the Council concluded that these lamps are satisfactory sources of thermal radiation, useful especially for the close-up irradiation of small areas of the body, such as the shoulder or the forearm, where they are more convenient and less likely to cause burns than are more powerful lamps with larger reflectors.

The Council voted to include the Sylvania 250 watt R40 infra-red lamps in its list of accepted devices.

Council on Pharmacy and Chemistry

REPORT TO THE COUNCIL

The Council has authorized publication of the following reports.

AUSTIN SMITH, M.D., Secretary.

EXCESSIVE CONCENTRATIONS OF SOLUTIONS SODIUM ASCORBATE NOT ACCEPTABLE

In considering the acceptance of solutions of sodium ascorbate it has been found that some brands are marketed in concentrations of vitamin C far in excess of that which may be necessary for the treatment of conditions resulting from deficiencies of this vitamin. Some of these products have been accompanied by representations that the product is intended for treatment of allergies. The evidence in support of this therapeutic procedure does not appear to be convincing, and there seems to be no justification for parenteral administration of this vitamin in excess of concentrations adequate to temporarily overcome severe deficiencies of the vitamin.

The Council has not heretofore and does not now contemplate recognition of claims for the use of injections of sodium ascorbate in the treatment of allergies. The Council therefore voted to limit its acceptance of injectable solutions of sodium ascorbate to concentrations representing 100 mg. of ascorbic acid per cubic centimeter or less.

METHADON CHANGED TO METHADONE

The Council recently published a report announcing recognition of the generic name "methadon" for 6-dimethylamino-4, 4-diphenyl-3-heptanone (J. A. M. A., Aug. 23, 1947, p. 1483). Subsequently, it was pointed out that inasmuch as the substance is a ketone and chemical nomenclature rules call for the names of ketones to end in "one," an appropriate change should be made in the adopted term. A poll of the various interested firms revealed that all recognized the logicity of this change, although not all were certain that such a change is necessary. However, in the interest of accurate nomenclature and on motion of the Council's Committee on Nomenclature, it was voted that recognition of the term "methadon" be revoked and that instead the term "methadone" (with a final "e") be recognized as the generic name for 6-dimethylamino-4, 4-diphenyl-3-heptanone. The name "methadon" will be retained as a synonym in N. N. R. until the revised spelling has become well established.

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., Secretary.

THIAMINE HYDROCHLORIDE (See New and Non-official Remedies 1947, p. 506).

The following dosage forms have been accepted:

R. E. DWIGHT & COMPANY, DES MOINES, IOWA

Tablets Thiamine Hydrochloride: 5 mg. and 10 mg.

LINCOLN LABORATORIES, INC., DECATUR, ILL.

Solution Thiamine Hydrochloride: 10 mg. per cc., 10 cc. vials. Preserved with chlorobutanol 0.5 per cent.

DIETHYLSTILBESTROL (See New and Nonofficial Remedies, 1947, p. 247).

The following additional dosage form has been accepted:

ABBOTT LABORATORIES, NORTH CHICAGO, ILL.

Solution Diethylstilbestrol in Oil: 5 mg. per cc., in peanut oil, 1 cc. ampul.

CONTRACEPTIVE CAPSULES AND SUPPOSITORIES (See New and Nonofficial Remedies 1947, p. 270).

The following dosage form has been accepted:

SPECIAL FORMULA CORPORATION, NEW YORK

Lygenes Vaginal Suppositories: 2.25 Gm. A vaginal suppository with an oil of theobroma base prepared from the formula:

	Per Cent
Boric acid	0.10
Zinc sulfocarbolate	0.50
Hydroxyquinoline benzoate	0.30
p-Chloro-symm. m-dimethyl hydroxybenzene.....	0.05
p-tert. amylhydroxy benzene	0.05
Beeswax, white	5.00
Corn starch	9.00
Perfume	0.20
Cocoa butter	84.80

Actions and Uses.—See article on Contraceptive Capsules and Suppositories.

Dosage.—One suppository.

DIENESTROL (See THE JOURNAL, Nov. 22, 1947, p. 773).

The following dosage form has been accepted:

RARE CHEMICALS, INC., HARRISON, N. J.

Tablets Dienestrol: 0.1 mg. and 0.5 mg.

DIETHYLSTILBESTROL-U.S.P. (See New and Non-official Remedies 1947, p. 347).

The following dosage form has been accepted:

BIO-INTRASOL LABORATORIES, INC., BROOKLYN

Solution Diethylstilbestrol in Oil: 1.0 mg. per cc. in sesame oil, 1 cc. ampuls.

MENADIONE-U.S.P. (See New and Nonofficial Remedies 1947, p. 533).

The following dosage form has been accepted:

R. E. DWIGHT & COMPANY, DES MOINES, IOWA

Capsules Menadione: 2 mg.

SULFADIAZINE-U.S.P. (See New and Nonofficial Remedies 1947, p. 120).

The following dosage form has been accepted:

COLE CHEMICAL CO., ST. LOUIS

Tablets Sulfadiazine: 0.5 Gm.

CORRECTION

Toxic Dose of BAL in Oil.—In the monograph on "2,3-Dimercaptopropanol in Oil.—BAL in Oil" (J. A. M. A. 137:368 [May 22] 1948) the statement appearing in the first sentence of the fourth paragraph under the heading "Actions and Uses," relative to the toxic dose of this drug, should read ". . . but doses of 300 mg. (5 mg. per kilogram of body weight) may produce . . ."

SATURDAY, OCTOBER 30, 1948

ST. LOUIS INTERIM SESSION

This issue of THE JOURNAL calls special attention to some of the features of the Interim Session of the Association to be held in St. Louis Nov. 30-Dec. 3, 1948. The features of this session include a graduate educational program, technical and scientific exhibits, general meetings of unusual quality and one evening devoted wholly to entertainment. The House of Delegates will hold its sessions and, as a new departure, the annual reports of officers and Board of Trustees will be considered in the Interim Session rather than in the Annual Session.

Attention is called particularly to the nature of the graduate educational program which has already been described in THE JOURNAL and which is unique. There will be discussions each morning and each afternoon, after which the audience will go in groups of about a hundred to separate halls, where consideration will be given to certain aspects of the subject discussed with presentation of cases. At the same time the scientific exhibits will make available the laboratory material used in such studies as well as other exhibits. The general meetings will include the award of the General Practitioner Medal and addresses by distinguished speakers. The evening of entertainment has been supplied by one of the advertisers in THE JOURNAL and includes the stars of a series of radio programs who are famous in the United States. Attendance at the entertainment will be limited to physicians and their families registered at the session and is not open to the general public.

The Technical Exhibit occupies all the space available in the auditorium and represents demonstrations of the new drugs, the new devices, the new books and other developments in medicine since the Annual Session last June.

The timing of all of these programs has been so arranged as to give ample opportunity for those registered in the session to participate in each of the sessions and also to visit both the scientific and the technical exhibits.

Already the registrations in hotels in St. Louis indicate a large attendance, but there will be ample space for others who send immediately for their hotel reservations.

THE ADVERTISING OF CIGARETTES

For some years THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, the state medical journals and most other medical publications have carried the advertisements of the various companies that manufacture cigarettes. Actual surveys indicate that the majority of physicians themselves smoke cigarettes. Extensive scientific studies have proved that smoking in moderation by those for whom tobacco is not specifically contraindicated does not appreciably shorten life. Postmortem examinations do not reveal lesions in any number of cases that could be definitely traced to the smoking of cigarettes. From a psychologic point of view, in all probability more can be said in behalf of smoking as a form of escape from tension than against it. Several scientific works have been published that have assembled the evidence for and against smoking, and there does not seem to be any preponderance of evidence that would indicate the abolition of the use of tobacco as a substance contrary to the public health. Physicians are no doubt familiar with the articles that have been published on the effects of tobacco on the circulation, the blood, the gastric acidity and other physiologic mechanisms within the human body. This editorial will not attempt to summarize that evidence or to derive any positive conclusions from it. It is concerned, rather, with the manner in which leading manufacturers have begun to lean so heavily on reference to the medical profession in promoting their products.

The advertising accepted by THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION has always been screened through various committees, and the evidence in behalf of the statements made has seemed to be sufficient to warrant the statements that appear in the advertisements. Gradually, however, claims point more and more toward the single factor of the extent to which certain cigarettes irritate the throat. One product is said to be less irritating than others, and the suggestion is made that persons who suffer irritation from other cigarettes try the one that is said to be less irritating. Another is said to be always milder; a third is said to be absolutely free from throat irritation as based on tests conducted under the supervision of physicians.

From time to time the manufacturers have sought for some positive chemical or physical factor related to the extent of irritation of the mucous membranes of the throat, and evidence and newer knowledge concerning growing, curing and blending have been accumulated in behalf of their contention.

Readers must remember that the cigarette business is a tremendous business and one that has increased continuously in volume for many years. The consumption of cigarettes has increased from approximately 10

billion cigarettes annually around 1910 to approximately 350 billion annually since 1946. The rise in consumption of cigarettes has paralleled the development of new techniques in advertising, utilizing the press, periodicals, the radio, motion pictures, television, sky writers, billboards, direct by mail, sampling, exhibits and every other technique. No doubt the manufacturers are aware of the trend in the promotion of alcoholic liquors and their abuse which finally led to the enactment of prohibition legislation. This may well be the path now being followed by the cigarette industry and one which will eventually lead to restrictive legislation unless voluntary restrictive policing is undertaken by the industry.

The publications of the American Medical Association have received a few protests from physicians relative to the advertising of cigarettes: The total number of letters would not exceed a dozen annually. Some protests have been stimulated by the competition in the cigarette industry since the users of glycerin are at war with the users of diethyleneglycol; since the purchasers of tobacco with less nicotine compete with those using tobacco with more nicotine, and since the manufacturers of devices that eliminate tar oppose the smoking of cigarettes without elimination of tar. Probably there is no other merchandise marketed in the United States in which the competition is fiercer or greater.

Now that the advertising has begun to concentrate on the factor of throat irritation, more attention will have to be given to the methods by which irritation of the throat can be measured. Pathologically, one considers the clinical signs and symptoms such as redness, congestion, swelling, exudation, pain, sensitivity and similar subjective symptoms and objective signs. Obviously, more refined techniques for study are in order.

Studies have been made of the throat utilizing color photography; yet none of the techniques by which throat irritation is measured is standardized. Furthermore, we know that the throat is easily irritated by various bacteria and viruses, as well as by chemicals and physical agents. It would be difficult indeed to differentiate between the irritation caused by the smoking of cigarettes and that caused by various bacteria, chemicals or heat. Manufacturers and the advertising agencies that develop this advertising are approaching a point in which the advertising is no longer significant. And yet one can remember when it used to be worse than it is now.

The Federal Trade Commission has been striving to hold this advertising within reasonable limits. Hearings have been held for a number of years and as yet a decision has not been forthcoming from the Federal Trade Commission as to claims that are justified by the evidence and those that are not. Further truly scientific studies and respect for intelligent advertising may obviate the need for further extensive and time-consuming trials.

CONGENITAL DEFECTS

Since Gregg and his associates¹ presented original evidence that maternal rubella infection in early pregnancy appeared responsible for the frequent development of congenital anomalies in infants subsequently delivered, evidence for the truth of this influencing factor has grown rapidly. Anomalies most commonly noted have been ocular defects, deafness, heart lesions, microcephalus, mental retardation and dental defects. Estimates of percentage involvement of the fetus from maternal rubella during the first three months of pregnancy range from 90 per cent (Australia) to 27 per cent (United States), with a graded decreasing expected anomaly rate from rubella infection in later pregnancy. Reports have been made of anomalous development following maternal infection in the eighth and ninth month of pregnancy. A woman contracting rubella during pregnancy has now approximately a ten to one chance of subsequently being delivered of a congenitally defective child.²

Fetal injury is believed to occur as a result of passage of rubella virus through the placental barrier, thereafter exerting a direct effect on early somatic fetal development. Paradoxically, rubella produces the same result when it occurs and subsides even before conception. Retention of the virus in maternal tissues and its later passage through the placenta to the fetus may occur. Other diseases occurring in early pregnancy and in the immediate preconception period, particularly infectious mononucleosis, are stated to result in congenital defects. Both restricted maternal diet and fetal irradiation are known to be capable of causing anomalous development in offspring of laboratory animals.

Recent experiments reported by Gillman, Gilbert and Spence³ should shed new light on the many unknown physiologic factors which bear on the problem of congenital anomalies. Believing that later effects of chronic malnutrition were causally related to a metabolic disorder induced by entry of abnormal particles into and by qualitative changes in plasma proteins, these investigators treated female rats with trypan blue because of its plasma albumin-binding properties. A random group of 100 breeding female rats and 25 male rats on normal stock diet were given repeated injections of 1 cc. of trypan blue at fourteen day intervals. Of the 100 females, 11 remained sterile. In a total of 697 offspring born in 118 litters, 19.2 per cent presented gross macroscopic malformations detectable at birth. Malformations such as hydrocephalus, spina bifida, tail defects, eye defects and defects of other systems ranged in decreasing numbers, averaging 1.4 anomalies per rat.

1. Gregg, N. McA.; Beavis, W. R.; Heseltine, M.; Machin, A. E.; Vickery, D., and Meyers, E.: The Occurrence of Congenital Defects in Children Following Maternal Rubella During Pregnancy, *M. J. Australia* 2: 122-126 (July 28) 1945.

2. Wesselhoft, Conrad: Rubella (German Measles) (Concluded), *New England J. Med.* 236: 978-988 (July 26) 1947.

3. Gillman, J.; Gilbert, Christine; Gillman, T., and Spence, Isobel: A Preliminary Report on Hydrocephalus, Spina Bifida and Other Congenital Anomalies in the Rat Produced by Trypan Blue, *South African J. M. Sc.* 13: 47-90 (March) 1948.

Timing of dye injection was extremely significant. In female rats that received injections before conception as well as one additional injection during pregnancy, incidence of abnormal pups was 25 per cent. Mother rats given injections the seventh day before conception as well as on the seventh day of pregnancy had an 80 per cent incidence of abnormal pups. Rats receiving only one injection on the day before conception showed a 25 per cent incidence of abnormal pups. Rats receiving one injection, on the sixteenth day before conception, gave birth to pups in which jaundice developed within the first three days of life. Among all offspring, high neonatal mortality, reduction in size of litters, low birth weights and a general retardation of postnatal development occurred.

The authors expressed the belief that the original hypothesis which prompted them to use trypan blue for producing congenital malformations proved efficient. The metabolic effect was operative when rats were fed a balanced diet. Trypan blue was bound to plasma albumin, and the use of the dye could be appropriately manipulated to increase the incidence of malformed offspring to 80 per cent. The authors cite what they consider to be an apparent parallel in the development of congenital defects in offspring of trypan blue-treated rats and defects in infants following maternal rubella infection. It is suggested that the supposed mode of action of the rubella virus on the human fetus be reexamined, as passage of virus through the placental barrier is debatable and as they have demonstrated that the trypan blue in maternal rats did not enter the fetus, the amniotic epithelium or amniotic fluid. All embryonic tissues apart from the yolk sac were free from trypan blue particles.

Discoveries concerning the connection between maternal rubella infection and developmental defects in offspring plus previously known similar effects of diet restriction and irradiation in animals and the described work of Gillman and associates³ with trypan blue open a tremendously important new field for basic research. If, as the experiments of Gillman and associates tend to demonstrate, the effects of trypan blue and, by inference, rubella virus, are not direct effects on the fetus but cause remote preceding metabolic states which subsequently interfere with fetal development, the speculative number of viruses, bacteria and chemicals which may produce such metabolic effects are legion. Additionally, the reported occurrence of congenital deformities from preconception effects of rubella infection and trypan blue definitely reduce the nature-nurture or heredity-environment argument regarding developmental influences to the preconception period, wherein affective metabolic states in the male must also be properly considered. While this does not diminish the absolute importance of gene influences, it most certainly increases the relative importance and scope of environmental factors to be considered in human development.

Also, of major importance is the fact that an azo dye compound (trypan blue⁴), formerly considered essentially nontoxic and recommended for use in human therapy, has been demonstrated to have serious consequences on development of animal offspring. Establishment of a wider field for testing toxicity of drugs for human use must now be carefully considered.

Current Comment

SARCOMAGENIC CELLOPHANE

In the course of experiments performed on rats to produce hypertension by wrapping cellophane film around one kidney, Oppenheimer¹ and his associates of Columbia University noted that sarcomas developed in several rats in the neighborhood of the cellophane. The sarcomagenic properties of cellophane film were therefore tested on 110 adult male rats. In 55 of these the left kidney was loosely wrapped with "highstretch" cellulose sausage casing, according to the method introduced by Page.² In the other 55 rats, a piece of cellophane 1 inch (2.5 cm.) square was embedded subcutaneously in the abdominal wall and kept in place by a surgical suture at each corner. Among the rats with the wrapped kidney, 23 survived over eleven months. Of these, 8, or 34.8 per cent, had large well defined tumors. Of the 55 rats in which the cellophane was embedded subcutaneously, 42 survived beyond eleven months. Of these, 15, or 35.7 per cent, had massive tumors. The tumors were usually allowed to grow to 2 to 5 cm. in diameter before the rats were sacrificed or used for transplantation experiments. Transplantations were made by inoculating tumor fragments subcutaneously into the anterior abdominal wall. A total of 199 secondary tumors were thus produced, of which 73 persisted and 126 subsequently receded. Retransplantations were carried out in some instances to the fifth generation. Histologic examinations showed that of the 23 primary cellophane tumors, there were 17 fibrosarcomas, 2 liposarcomas, 1 rhabdomyosarcoma, 1 plasmocytoma, 1 osteogenic sarcoma and 1 undifferentiated sarcoma. Metastases were noted in 3 cases. Sixty-three of the 73 persistent tumors derived from transplantation were fibrosarcomas. In the perirenal series the shortest time taken for the production of a sarcoma was three hundred and sixty-two days. In the subcutaneous series the shortest period of development was four hundred and seventy-one days. Thus far, there have been no reports of similar delayed sarcomagenic effects from the use of cellophane sheaths or coverings in surgical treatment in human beings. The nature of the sarcomagenic factor in commercial cellophane has not yet been determined.

4. Dorland's American Illustrated Medical Dictionary, twentieth edition, Philadelphia, W. B. Saunders Company, 1947, states, "trypan blue, an acid, azo dye which has been used in vital staining and as a remedy in protozoan infections. It is the sodium salt of toluidin-diazo-diaminonaphthol-disulfonic acid."

THE INTERIM SESSION

AMERICAN MEDICAL ASSOCIATION

ST. LOUIS, NOV. 30-DEC. 3, 1948

OFFICIAL CALL

TO THE OFFICERS, FELLOWS AND MEMBERS OF THE AMERICAN MEDICAL ASSOCIATION

The interim session of the American Medical Association will be held in St. Louis, Nov. 30-Dec. 3, 1948.

The House of Delegates will convene at 10 a. m., Tuesday, November 30. In the House the representation of the various constituent associations for the interim session in 1948 is as follows:

Alabama	2	Massachusetts	6
Arizona	1	Michigan	5
Arkansas	2	Minnesota	4
California	9	Mississippi	1
Colorado	2	Missouri	4
Connecticut	4	Montana	1
Delaware	1	Nevada	1
District of Columbia	3	Nebraska	2
Florida	3	Nevada	1
Georgia	3	New Hampshire	1
Idaho	1	New Jersey	5
Illinois	9	New Mexico	1
Indiana	4	New York	20
Iowa	3	North Carolina	3
Kansas	2	North Dakota	1
Kentucky	2	Ohio	7
Louisiana	2	Oklahoma	2
Maine	1	Oregon	2
Maryland	2	Pennsylvania	10

Rhode Island	1	Washington	2
South Carolina	1	West Virginia	2
South Dakota	1	Wisconsin	3
Tennessee	2	Wyoming	1
Texas	5	Alaska	1
Utah	1	Hawaii	1
Vermont	1	Isthmian Canal Zone	1
Virginia	2	Puerto Rico	1

The scientific sections of the American Medical Association, the Medical Corps of the Army, the Medical Corps of the Navy and the Public Health Service are entitled to one delegate each.

The Scientific Program will open Tuesday, November 30, starting at 2 p. m., and will continue throughout the afternoon of that day. The program will continue on Wednesday and Thursday mornings and afternoons, December 1 and 2, and on Friday morning, December 3, closing at 12 noon. The gold medal for an outstanding general practitioner will be presented on Thursday evening December 2.

The Registration Bureau, which will be located on the lower level of the St. Louis Municipal Auditorium, will be open from 8:30 a. m. until 5:30 p. m., Tuesday, Wednesday and Thursday, November 30 and December 1 and 2, and from 8:30 a. m. to 12:00 noon, Friday, December 3.

R. L. SENSENICH, President.
F. F. BORZELL, Speaker, House of Delegates.

Advisory Committee—Howard F. Root, Boston; Paul J. Hanlik, San Francisco; Ludwig Hektorn, Chicago; Urban Maes, New Orleans; Max M. Peet, Ann Arbor, Mich.; James P. Leake, Washington, D. C.

REGISTRATION

The Bureau of Registration will be located on the lower level of the Municipal Auditorium. An information bureau will be operated in connection with the Bureau of Registration.

Who May Register

Only Member and Service Fellows, Affiliate, Associate and Honorary Fellows, qualified physicians who apply for Fellowship, medical students of approved medical schools, who are certified to the Secretary of the Association by their respective deans, or interns or residents who are graduates of approved medical schools who are certified to the Secretary of the Association by the superintendents of their respective hospitals, and Invited Guests may register for the Scientific Assembly. Fellows of the Scientific Assembly are those who have, on the prescribed form, applied for Fellowship, subscribed to *THE JOURNAL*, and paid their 1948 Fellowship dues. Fellowship cards are sent to all Fellows after payment of annual dues and these cards should be presented at the registration window. Any who have not received cards for 1948 should secure them at once by writing to the American Medical Association, 535 North Dearborn Street, Chicago 10.

Members in Good Standing Eligible to Apply for Fellowship in the Association

Members in good standing in the American Medical Association are those members of component county medical societies and of constituent state and territorial medical associations whose names are officially reported for enrolment to the Secretary of the American Medical Association by the secretaries of the constituent medical associations. All members in good standing may apply for Fellowship in the Scientific Assembly and are urged to qualify as Fellows before leaving home in order that pocket cards may be secured and brought to St. Louis so that registration can be more easily and more promptly effected.

Application forms may be had on request.

Those subscribers to *THE JOURNAL* who have not received pocket cards for 1948 should write to the American Medical Association in order to obtain application blanks and information as to further requirements.

Register Early

Fellows living in St. Louis as well as all other Fellows who are in St. Louis on Tuesday and Wednesday should register as early as possible.

The names and local addresses of those who register will be included in the issue of the *Daily Bulletin* appearing the next day, and this will enable visiting physicians to find friends who have registered.

Suggestions That Will Facilitate Registration

Fellows should fill out completely the spaces on both sections of the front of the registration card. Physicians who desire to qualify as Fellows should fill out completely the spaces on both sections of the front of the registration card and sign the application on the back. These cards will be found on the tables.

Entries on the registration card should be written plainly, or printed, as the cards are given to the printer to use as "copy" for the *Daily Bulletin*, which appears on Wednesday, Thursday and Friday mornings during the week of the session.

Fellows who have their pocket cards with them can be registered with little or no delay. They should present the filled out registration card, together with the pocket card, at one of the windows marked "Registration by Pocket Card." There the clerk will compare the two cards, stamp the pocket card and return it and supply the Fellow with a badge and a copy of the official program.

Those Fellows who have sent in their registration card previous to the session should present at any window the identification card sent them after they registered prior to the session.

As previously stated, it will assist in registering if those who desire to qualify as Fellows will file their applications and qualify as Fellows by writing directly to the American Medical Association, 535 North Dearborn Street, Chicago 10.

It will be possible for members of the organization to qualify as Fellows at St. Louis. In order to do this, applicants for Fellowship will be required to fill out both sections of the front of the registration card and to sign the formal application that is printed on the reverse side of the card. It is suggested that those members who apply for Fellowship at St. Louis bring with them their state membership cards for the year 1948. The state membership card should be presented along with the filled in registration card at the window in the booth marked "Applicants for Fellowship and Invited Guests."

As already stated, registration can be effected more easily and more promptly if members will qualify as Fellows before leaving home.

Registration for General Officers and Delegates

General officers of the American Medical Association and members of the House of Delegates may register for the Scientific Assembly outside Assembly Room 2 on the second floor of the Municipal Auditorium on Tuesday, November 30, before registering with the Reference Committee on Credentials and are advised *not* to register at the Registration Bureau since registration cards have already been made out for their use at Assembly Room 2. It will also be possible for them to register on Sunday, November 28, or Monday morning, November 29, in the office of the Secretary of the Association, Room 116, Hotel Statler.

This arrangement is made for the convenience of members of the House of Delegates, which will convene on Tuesday morning at 10 o'clock in Assembly Room 2 of the Municipal Auditorium. Delegates are requested to register for the Scientific Assembly before presenting credentials to the Reference Committee on Credentials of the House of Delegates. Delegates are urged to register early so that all members of the House of Delegates may be seated in time for the opening session of the House.

TRANSPORTATION

It is suggested that those Fellows who contemplate traveling to St. Louis to attend the interim session of the Association secure information concerning railroad and airplane travel

directly from their local ticket agents, who are in a position to give them information regarding train or plane schedules and fares.

ST. LOUIS HOTELS

It is suggested that if hotel reservations have not yet been secured by Fellows who expect to attend the St. Louis session, such Fellows filling in and sending directly to Dr. F. G.

PERNOUD, SUBCOMMITTEE ON HOTELS, 1420 Syndicate Trust Building, St. Louis 1, Mo., the application form which may be found in the advertising pages of this *JOURNAL*.

MEETING PLACES

HOUSE OF DELEGATES: Assembly Room 2, St. Louis Municipal Auditorium.

SCIENTIFIC MEETINGS: Opera House, Assembly Room 1 and rooms in Scientific Exhibit, all in St. Louis Municipal Auditorium.

PRESENTATION OF GENERAL PRACTITIONER'S MEDAL: Opera House, St. Louis Municipal Auditorium.

GENERAL HEADQUARTERS, REGISTRATION BUREAU, SCIENTIFIC EXHIBIT, TECHNICAL EXHIBITS AND INFORMATION BUREAU: St. Louis Municipal Auditorium.

Wednesday evening entertainment in Opera House of Municipal Auditorium, 7:30 p. m.

The St. Louis Municipal Auditorium is located on Fourteenth Street at Market Street.

HOUSE OF DELEGATES

The House of Delegates will meet at 10 a. m., Tuesday, Nov. 30, 1948, in Assembly Room 2, Municipal Auditorium, Fourteenth Street at Market Street.

The Reference Committee on Credentials will meet in the foyer outside Assembly Room 2 at 8:30 a. m., Tuesday, Nov. 30, 1948. Credentials should be presented to the Reference Committee on Credentials as early as possible, so that the official roll of the House may be made up and so that the House of Delegates may organize promptly and proceed with its business. The Reference Committee on Credentials will also meet preceding each subsequent meeting of the House of Delegates.

Each delegate should present properly executed credentials signed by the president and the secretary of the constituent association or by the chairman and the secretary of the section he represents. Alternates presenting credentials should see that the delegates whose places they are to take have signed the alternate authorization.

Each delegate, before registering with the Reference Committee on Credentials, should register for the Scientific Assembly at a booth located at the head of the stairs leading to the lobby where the Reference Committee on Credentials will register delegates.

Rooms have been provided for the use of committees of the House of Delegates. Reference committees are urged to have their meetings in these rooms and to announce the time of their meetings, so that any who are interested in matters referred may be able to appear before the committees.

Typists will be at the service of the members of the House of Delegates for preparing official reports, resolutions and motions.

There should be eight copies of all reports of committees, resolutions, written motions, etc., presented in the House, one copy for preservation in the minutes, six to go to the committee to which the matter may be referred and one to be used as "copy" for the Proceedings. The eight copies must be handed to the Secretary at the time the matter is presented. Typists in attendance will gladly make these copies on request.

MEETING ROOMS OF REFERENCE COMMITTEES IN THE MUNICIPAL AUDITORIUM

Reference Committee on—

- Amendments to the Constitution and By-Laws Committee Room B(1), Second Floor
- Hygiene and Public Health.....Committee Room A, Second Floor

WEDNESDAY, DECEMBER 1, 1:15 P. M.

1. Supplementary Report of Reference Committee on Credentials.
2. Reading and Adoption of Minutes.
3. New Business.
4. Executive Session.
5. Reports of Reference Committees and Other Unfinished Business.

REPORTS OF OFFICERS

REPORT OF THE SECRETARY

To the Members of the House of Delegates of the American Medical Association:

The following report of the Secretary is respectfully submitted:

MEMBERSHIP AND FELLOWSHIP

Heretofore in making annual reports of membership and Fellowship, the Secretary has reported the number of members and Fellows as of March 1 or April 1. Now that the House of Delegates has decided to receive annual reports only at its interim sessions, and also since the revised Constitution and By-Laws adopted at the 1948 annual session provides that the appointment of delegates shall be made annually in accordance with the number of members in each constituent association as of December 1, in 1949 and thereafter it will be possible to present the usual comparative table showing the organization of constituent associations on December 1. The current report covers the nine month period from Jan. 1 to Oct. 1, 1948.

On Jan. 1, 1948, 135,518 physicians were members of the American Medical Association and 76,278 were Fellows. On October 1 the membership roll contained 139,776 names and the number of names on the Fellowship roster had increased to 78,331. The increase in membership over the nine month period was 4,258, and that in Fellowship was 2,053. Thus, the Association continues to grow in strength of numbers.

Steps have been taken to procure the names of physicians who are members of the permanent medical staff of the Veterans Administration in order that, in accordance with the action of the House of Delegates in June, their names may be entered as those of Service Fellows of the American Medical Association in the same manner as are the names of the regular medical officers of the Army, Navy and Public Health Service. The complete roster of Veterans Administration physicians is not yet available. It is anticipated that when the names are received there will be a substantial increase in the number of names on the Fellowship roster.

FIELD ACTIVITY

During the year 1948 the Secretary has visited constituent medical associations in seven states and one territory, namely; California, Texas, New York, Wyoming, Colorado, Kentucky, Wisconsin and Hawaii. With the exception of the visit to the Hawaii Territorial Medical Association, these visits have all been made at the time of annual meetings, and the Secretary has spoken at each meeting on the work and accomplishments of the American Medical Association. In addition, the Secretary is a member of a number of committees of government and other agencies in the medical field and has attended numerous meetings in various places. In all cases, trips away from the office have been arranged so as not to conflict with the regular business of the Association, and that has been easier to accomplish this year because the Assistant Secretary, Dr. Ernest B. Howard, has been available at all times in the absence of the Secretary.

RÉSUMÉ OF MATTERS REFERRED BY HOUSE OF DELEGATES

Through his own office or by reference to the proper departments at headquarters, the Secretary has carried out the mandates of the House of Delegates at the Chicago Session as follows:

Resolution on Method of Selecting Each Year the Outstanding General Practitioner by the American Medical Association:

A letter incorporating this resolution was sent to the secretary of each constituent state and territorial medical association.

Resolutions on American Physicians Art Association: These resolutions were transmitted in a letter to the secretary of that organization.

Election of Honorary Fellows: Appropriate letters accompanied by Certificates were sent to the three foreign physicians elected to Honorary Fellowship.

Recommendation that Constituent Associations Set Terms of Delegates to Begin on January 1 Following Elections: The revised Constitution and By-Laws solves this problem. The attention of each state and territorial association secretary has been called to the change, and the information has been further disseminated through the Secretary's Letter.

Resolutions on Paying Physicians Engaged in Examinations for Armed Forces: A letter conveying these resolutions was sent to the Director of the Selective Service System. His reply is contained in the Report of the Board of Trustees.

Resolution on Policy of Federal Children's Bureau: This resolution was transmitted in a letter to Hon. Oscar R. Ewing, Federal Security Administrator, and his reply will be found in the Report of the Board of Trustees.

Resolution Requesting Veterans Administration to Put into Uniform Practice a Free Choice Regulation for Medical and Hospital Treatment: A letter concerning this was sent to the Chief Medical Director of the Veterans Administration.

Resolution on Funds to Defray Expenses of Woman's Auxiliaries of States: The secretary of each state association received a letter calling attention to this resolution.

Resolutions on Advancement in Rank of Surgeons General of Army and Navy and of Air Surgeon: Letters transmitting these resolutions were sent to the President, the Secretary of Defense, the Secretaries of the Army, Navy and Air Force and the members of the Committee on Armed Services of the Senate and the House of Representatives. Acknowledgments have been received from most of those to whom the communication was sent.

Resolution on Staff Personnel at Headquarters: Employees have been advised that they cannot take either a positive or a negative stand on any legislative matter pending before the House of Delegates.

Recommendations contained in the Report of the Committee to Study Conditions of General Practice and in the Report of the Committee on Intern Placement, and the Resolutions on Association of Interns and Medical Students and on Shortage of Interns are referred to in the Report of the Council on Medical Education and Hospitals.

A report of action with respect to the Resolution on Compulsory Cash Sickness Compensation (the "Rhode Island Resolution") is included in the Report of the Council on Medical Service and the Report of the Board of Trustees.

Resolutions on Hospital Exploitation of Medical Services and the Resolution on Approval of Hospitals were referred to the Committee on Hospitals and the Practice of Medicine, Dr. Elmer Hess, Pennsylvania, Chairman.

Bureau of Legal Medicine and Legislation instructed to study the laws of the several states to determine whether a corporation may lawfully practice medicine: The Bureau now has under way a comprehensive study.

The intent of the resolution concerning the interest of the American Medical Association in a medical graduate program in the armed forces, the resolution commending the Secretary of Defense for appointment of a Committee on Medical and Hospital Services of the Armed Forces, and the resolution urging appointment of a Civilian Medical Coordinating Board to advise the National Security Resources Board was transmitted to the President, the Secretary of Defense and the Secretaries of the Army, Navy and Air Force before the close of the Chicago Session.

Resolutions on Emergency Medical Service: The Council on National Emergency Medical Service is engaged in efforts to carry out the intent of these resolutions.

The following resolutions have been referred to the Board of Trustees, and reference to them will be found in the Report of the Board: Resolutions on Federal Grants-In-Aid to States; Resolution on Compulsory Cash Sickness Compensation; Resolution on Cancer Detection Centers.

RESOLUTIONS AND MEMORIALS

No resolutions or memorials for presentation to the House of Delegates at the interim session have been received from any delegate or any constituent association.

IN APPRECIATION

The Secretary wishes to express his grateful appreciation for the many courtesies extended to him throughout the year by the officers, delegates, members of councils and committees and members and Fellows. The Office of the Secretary of the American Medical Association is open at all times to any member who may wish to visit it.

The Secretary wishes to express particularly his appreciation of the fine and loyal service extended by so many employees at the headquarters office during a trying year.

Respectfully submitted,

GEORGE F. LULL, Secretary.

REPORT OF THE BOARD OF TRUSTEES

To the Members of the House of Delegates of the American Medical Association:

The following annual report of the Board of Trustees is respectfully submitted to the House of Delegates.

Income and Expenditures

At the Cleveland Interim Session of the House of Delegates Fellowship dues and subscriptions to THE JOURNAL were increased from \$8 to \$12. This increase was necessary in order to balance the budget for 1948; a deficit for 1947 was already realized.

Recapitulation

	1948	1947	1946	1945
Income exhibit A.....	\$3,614,000	\$3,061,802	\$3,076,612	\$2,909,914

Postage, second class.....	75,963	95,315	83,609	60,479

This increase has been the means of keeping the Association's financial head above water. Increases in wages, salaries, material and services have caused a considerable increase in expenditures.

Following are figures showing sums expended for the major activities of the Association in 1948 (estimated), compared with amounts expended in 1945, 1946 and 1947 for similar activities, as well as a comparison of receipts in these years:

The Journal of The American Medical Association

The circulation of THE JOURNAL continues to be maintained at its peak. The JAMA, as it is called in Europe, is recognized everywhere as the leading medical periodical. Through recommendation by the State Department, it is now published regularly in a condensed edition in the Japanese language, and negotiations have been proposed to publish a condensed edition in Italian and in Spanish.

So numerous are the requests for exchange with THE JOURNAL from publications in other countries that it has become necessary to restrict the exchange list rigidly.

With the availability of many foreign periodicals, the Current Medical Literature columns are being enlarged and more abstracts of original articles are being published.

The Foreign Correspondence in THE JOURNAL has been elaborated further.

Special issues are regularly devoted to medical education, hospitals, state board licensure, the Annual Session, the Interim Session and the indexes.

The columns of THE JOURNAL have been so pressed for space that the Editor welcomes the new action of the Council on Scientific Assembly in restricting some of the sections, which are now numerous, to two meetings instead of three meetings at a session.

The Councils, Bureaus, Committees and departments of the Association are now so numerous that they constitute a special problem with relationship to space in THE JOURNAL. The Board of Trustees has under consideration a special publication to be devoted largely to the social, economic and industrial aspects of medicine. Nevertheless, THE JOURNAL is the one publication most widely read by the medical profession as shown by innumerable surveys and the activities of these various agencies are so important that they should be kept constantly before the medical profession.

During 1947-1948 THE JOURNAL published a series of articles on cancer in cooperation with the American Cancer Society. These attracted major interest and are now in process of being published in book form. A series of articles is also in process on nutrition, and these too will be published in book form when completed.

The weekly average net paid circulation of THE JOURNAL and the weekly average of copies printed cannot be reported at this time, since the necessary figures will not be compiled until after the first of the year. However, the reports as of Sept. 1, 1948, show that on that date the number of copies circulated was 142 less than on Jan. 1, 1948.

FIELD SERVICE OF THE EDITORIAL STAFF

Many calls come to the editorial staff of the American Medical Association for addresses on a variety of subjects to audiences of both the medical profession and the public. They participate also in educational courses before various medical societies and educational institutions.

Special Journals

During the time of the labor difficulties with Local 16, Chicago Typographical Union, March 8 to June 28, the publication of the special journals was suspended. As negotiations with the Union seemed to be unsuccessful and it appeared that the difficulties might continue indefinitely, arrangements were made with a Tennessee concern to publish the special journals. Since May manuscripts have been sent to Tennessee to be put into type. Thus far three issues have been printed and distributed.]

from Nashville, but eight additional issues are in course of completion.

In August it was decided to bring three of the periodicals back to the Association's plant, the ARCHIVES OF SURGERY, the ARCHIVES OF OPHTHALMOLOGY and OCCUPATIONAL MEDICINE. With the two plants working on the periodicals, the usual schedules should be reached by the end of the year.

In spite of the labor difficulties and a shortage of help in the Editorial Department, every effort has been made to maintain the high quality of the periodicals. Two additional manuscript editors have recently been added to the staff.

A supplement to the March issue of the ARCHIVES OF DERMATOLOGY AND SYPHILOLOGY was published containing society transactions only because the reports of fourteen dermatologic societies are received for publication in that periodical. Most of these societies hold nine meetings a year, which means that over one hundred reports are received each year. Many of the reports have been so long that during the paper shortage a considerable backlog occurred. The Editorial Board is now culling unimportant material from these reports, and after the publication of another supplement this fall it will be possible to keep up to date with the publication of the reports of these societies.

The September issue of the ARCHIVES OF DERMATOLOGY AND SYPHILOLOGY will be a festschrift in honor of Dr. George Miller MacKee.

According to the estimates made by the Accounting Department, there will be a gain for the year of \$35,733 on five of the special journals and a loss of \$21,918 on the other four, making a net gain of \$13,815 on the nine journals.

Standard Nomenclature of Disease and Standard Nomenclature of Operations

The success of this publication has been outstanding. A new committee has been organized to produce a new edition of the Standard Nomenclature, and Dr. George Baehr, who served as chairman of the previous committee, will be chairman of the new committee. The remaining members of the committee include:

Dr. James R. Miller, Hartford, Conn.
Dr. Halbert L. Dunn, Washington, D. C.
Dr. Selwyn E. Collins, Washington, D. C.
Dr. Edward T. Thompson, Chicago.
Dr. Edwin L. Crosby, Baltimore.
Dr. Morris Fishbein, Chicago.
Dr. R. J. Plunkett, Chicago.
Mrs. Adaline Hayden, Chicago.

This committee will hold its meeting in December 1948 and at that time will organize the development of the new edition. The Standard Nomenclature is used throughout the world, and translations have been made into Portuguese.

Hygeia

HYGEIA is the leading publication in the health field in the United States. As a source for authentic material, it is used by schools, educational groups, industrial organizations, lecturers and voluntary health organizations. HYGEIA is more quoted by various digest magazines than any other publication in the United States. Many newspapers and radio stations also utilize HYGEIA as a source of material. HYGEIA has aided campaigns against poliomyelitis, cancer and heart disease and for the improvement of sanitation. The American Red Cross has cooperated with articles regularly published in HYGEIA. A special section has been developed dealing with child care and behavior.

Over a period of more than twenty-five years HYGEIA has yielded a profit to the Association. However, the periodical is published as an educational, philanthropic venture and not with the idea primarily of producing income. In 1947, for the first time in seven years, HYGEIA had a loss. It now has, however, a new high in circulation, and much of the loss represents funds expended to increase circulation.

Because of the demands on the press of the American Medical Association it has been impossible to continue printing the publication on the American Medical Association press. It is now printed by Kable Brothers in Mount Morris, Ill.

Book Publications

The American Medical Association press has in the past issued many books which have attained large circulation among the medical profession. Some of these books represent compilations of series of articles published in THE JOURNAL; others originated with individual Councils and Bureaus of the Association. The increasing demands made on the press of the Association made it impossible to continue to publish such books, and they are, therefore, published under the auspices of the Association by independent publishers.

Library

Demands for library service from members of the Association increased considerably during 1948. Approximately 2,500 package libraries were provided and about 250 requests were denied service because of nonmembership in the Association. The most popular requests for the year were for information on the new antibiotics, new drugs, anesthetics, alcoholism and undulant fever.

The periodical lending service continued to be as popular as it has for many years past. Approximately 10,000 journals were sent out on loan. The various Veterans Administration libraries throughout the country have continued to call on the library with increasing demands for its type of library service.

Requests for the establishment of exchanges from publications issued in foreign countries with publications of the American Medical Association decreased somewhat during the year.

Three volume indexes of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION were prepared, as usual, in the library. Unfortunately, because of the printing situation, indexes for volumes 136 and 137 were not published in the final issues of those volumes for the first time in the history of the publication. A return to the usual schedule of publishing the index of THE JOURNAL in the final issue of volume 138, covering September-December, 1948, is anticipated.

Quarterly Cumulative Index Medicus

Despite every effort to resume publication of the QUARTERLY CUMULATIVE INDEX MEDICUS on schedule, the progress made in 1948 was disappointing. Volume 41 of the INDEX, covering January-June 1947, was distributed to subscribers about May 1, 1948. This volume represents the only one completed during the year. Volume 42, July-December, 1947, has been entirely put into type, but the completion of publication and distribution to subscribers cannot be hoped for until early in 1949.

Because of the tremendous demand for extra copies of the QUARTERLY CUMULATIVE INDEX MEDICUS now out of print, 300 additional copies were reproduced covering each of the volumes from 1 to 24. Most of these have already been sold, and maintenance of a stock of approximately 100 copies of each of the volumes of the QUARTERLY has been authorized.

World Medical Association

A complete report on the present status and activities of the World Medical Association was printed in the Organization Section of THE JOURNAL for Oct. 9, 1948. Since the members of the House of Delegates undoubtedly are familiar with the content of the report, it does not appear to be necessary to include it here. Copies of JOURNAL pages will be available at the interim session for the purposes of reference committees.

Consultants for General MacArthur

In 1947 General Douglas MacArthur requested, through government channels, the services of certain experts to aid him in revising and reestablishing Japanese social security laws including sickness insurance. The experts furnished were for the most part persons who were federal employees and ardent proponents of compulsory sickness insurance. The Board of

Trustees complained about this situation, and as a result General MacArthur requested that a group of representatives of the American Medical Association be sent to Japan on a consultant status.

Drs. E. L. Henderson, Ernest E. Irons, R. L. Sensenich, Edward J. McCormick and John H. Fitzgibbon were appointed consultants and visited Japan in the late summer. The report in full will be made to General MacArthur and, when released by him, will be given space in *THE JOURNAL*.

The Ewing Report

Under a release date of Sept. 2, 1948, the Ewing Report to the President on "The Nation's Health, A Ten Year Program" was given to the public. This report devotes considerable space to a plea for government medical care supported by a compulsory taxation system. The report appears to be purely politically inspired, and little space should be given to it here. While the medical profession as a whole may take this report for what it is worth, there are many lay persons who will be convinced of the merit of some of the recommendations. It is hoped that every physician will familiarize himself with the principal features so that he may be able to turn the searchlight of truth and understanding on it.

National Health Assembly

Early in the year the Federal Security Administrator, Hon. Oscar R. Ewing, at the suggestion of the President, called a large meeting of both lay and professional persons who were interested in health affairs. The Association was represented by the President, the President-Elect and the Secretary, the latter of whom served as a member of the Executive Committee of the Assembly. In the various sections and panels, officers and Fellows of the Association played important roles. An analysis of the registrants at the National Health Assembly, which was held May 1-4, shows that 33 persons representing the American Medical Association directly or indirectly were present. In addition there were 66 other physicians out of a total registration of approximately 350.

Matters Referred by House of Delegates

Resolution on Cancer Detection Centers: The Board of Trustees is cooperating with the American Cancer Society in accordance with the provisions of this resolution.

Resolutions on Federal Grants-In-Aid to States: Careful consideration has been given these resolutions by the Board of Trustees, and the Board will continue to scrutinize pending legislation which does not contain the principle that federal grants-in-aid should not be extended to any state which has not clearly demonstrated an absolute need for federal assistance.

Resolution on Compulsory Cash Sickness Compensation: This resolution expressed dissatisfaction that a study had not been conducted of the Rhode Island Cash Sickness Benefits Program as requested in a resolution presented to the House of Delegates in 1946. The 1946 resolution was brought to the attention of the Council on Medical Service early in 1947, and since that time the Council has followed carefully the developments in regard to this type of legislation throughout the United States. Reports were submitted to the House of Delegates in June 1947, January 1948 and June 1948, as follows:

June, 1947: Interest in and legislation concerning insurance against loss of wages during sickness indicate a need for a study of the subject. The Board of Trustees has referred the matter to the Council.

January, 1948: The Council continues to follow legislative developments in the various states and has made it a point to maintain a liaison with the Railroad Retirement Board in regard to cash sickness benefits. At the time of the June session the Council reported on the introduction of thirty-two "cash sickness" bills in the legislatures of thirteen states. Since then eleven bills have been added, making a total of some forty-three bills introduced in sixteen state legislatures. These bills generally provide for the establishment of a system of sickness benefits

or "health insurance." The growth in interest in this type of legislation is shown by the fact that only ten bills were introduced in state legislatures in 1935-1936, as compared to thirty-nine in 1945 and forty-three in 1947.

June, 1948: The House of Delegates approved the principle of cash sickness benefits in 1938. Since that time interest in the subject, particularly on the part of state legislatures, has developed rapidly. Fifty proposals for cash sickness and related benefits were introduced in state legislatures in 1947. Of this number, twenty-five provided for specific cash state fund, with affiliation compulsory. The implications of this type of program warrant serious consideration. The House of Delegates recognized this when it approved a resolution requesting "a complete study of the existing and proposed compulsory temporary disability compensation programs." The resolution was referred to the Council on Medical Service, and since then the staff has followed closely the developments in various states. These developments were reported to the House in June 1947 and in January 1948.

The Council has postponed a detailed study until experience from more than one type of program can be obtained and compared. The Rhode Island (monopolistic) plan has been in operation over five years, the California (optional) plan over one year and the Railroad Retirement Board (national) plan almost a year. Studies of these three, together with a number of the proposed plans, should provide a reasonable appraisal of the subject. A study of the Rhode Island plan has recently been completed by Miss Elizabeth Wilson, and arrangements have been made to have access to the results of the study. Studies of the two other plans will be undertaken in cooperation with the Bureau of Medical Economic Research unless the Council discovers existing studies comparable to that of Miss Wilson. The Council is primarily interested in the medical aspects of cash sickness benefit programs and will make every effort to arrive at definite recommendations.

Resolutions on Paying Physicians Engaged in Examinations for the Armed Forces: These resolutions were transmitted in a letter to Mr. Lewis B. Hershey, Director of the Selective Service System, who replied as follows:

"This acknowledges your letter of Aug. 12, 1948, wherein you advise that the House of Delegates of the American Medical Association adopted the resolutions of the New Hampshire Medical Association concerning the payment of fees by the Selective Service System for examination of registrants.

"It is regretted that the House of Delegates of the American Medical Association should have taken such action. The backbone of the Selective Service System is its uncompensated personnel operating in the many communities of the nation. Representative citizens are asked to serve as members of local boards, members of appeal boards, government appeal agents, advisors to registrants, and medical advisors. These people operate as understanding neighbors and in the past have performed, without compensation, a work that is immeasurable. It is our desire to have local physicians participate in this work as medical advisors to the local boards. Of course, if the members of your association refuse to participate without fee, it will be necessary that the American Medical Association go to Congress to support an appropriation for fees, or else we will have to dispense with the services of those who refuse.

"Under the limited system now being organized with high physical standards by the armed forces, we do not expect to examine men at local board level except when a registrant claims to have an obvious defect or a manifest physical condition which would disqualify him for service. This, of course, will limit the amount of medical work necessary.

"I might add that it is not my opinion that the resolutions adopted by the American Medical Association represent the feeling of the doctors of this country. As we organize the new Selective Service System, many of our State Directors have long lists of doctors who have signified their desire and willingness to serve. It was gratifying to me that our representative at your meeting in Chicago reported that he recognized numerous lapel emblems which were issued to our former medical examiners by the Selective Service System. He identified himself to many of these doctors, and invariably he was told that they were ready and willing to serve again if the need arose."

Resolution on Policy of Federal Children's Bureau: This resolution directed the Board of Trustees to recommend that the policy of the Children's Bureau whereby only surgeons certified by the American Board of Orthopedic Surgery or eligible for such certification may be approved by a state agency for surgical service to children suffering from orthopedic conditions be liberalized so as to permit all qualified surgeons, whether or not certified by the American Board of Orthopedic Surgery, to be approved for such service. The following reply was received from Hon. Oscar R. Ewing, Federal Security Administrator, to whom the resolution was sent:

"I have discussed with staff of the Children's Bureau the resolution relating to desirable qualifications for surgeons participating in State crippled children's programs, adopted by the House of Delegates of the American Medical Association. It comes somewhat as a surprise to learn of this recommendation by the American Medical Association since we believed that the medical profession had always supported the efforts of the Children's Bureau and its advisory group of outstanding professional leaders over a long period of years, in the development of standards which would assure the highest quality of care for crippled children. It was our belief that the development of boards for approval of physicians who have demonstrated competence in special fields had been fully supported by the American Medical Association. The Children's Bureau advisory committees have on two occasions, 1936 and 1944, recommended that 'only surgeons who are certified by the American Board of Orthopedic Surgery, or are eligible for such certification should be approved by a state agency for surgical services for children suffering from orthopedic conditions.' In other words, they recommended that an orthopedic surgeon who had the training and experience required by such board, whether or not he is also a Fellow of the American College of Surgeons, be considered eligible for participation in the state crippled children's programs. There seem to be no other satisfactory criteria for determining competence in the special fields of medicine.

"The American College of Surgeons raised this same question with the Army, Navy, Veterans Administration, and the Children's Bureau, a year or so ago and was asked by all of the Government agencies to get together with the American Boards to avoid any duplication in approving specialists in surgery. The American College of Surgeons does not distinguish between general, plastic, orthopedic, neuro, and other specialties of surgery. Such distinctions seem essential for agencies employing surgeons or purchasing surgical care.

"Public agencies which have responsibility for administering a broad program of services for crippled children, have, in my mind, the duty to assure each child the highest quality of services available.

"It is not clear to me how such standards, as recommended by the advisory committee to the Children's Bureau, could constitute an arbitrary limitation on the right to practice medicine within the scope of state licenses and recognized professional qualifications, as indicated by the American Medical Association resolution.

"There is reference in the resolution to honoring of signatures on reports and prescriptions for prosthetic appliances. Crippled children are accepted by the state agencies for the provision of all services needed to restore the child to the maximum physical and mental health. When a child is found by the state agency to be in need of care because of a physical condition for which treatment can be made available under the program, the child is accepted for care and the state agency becomes responsible for the provision of medical services, hospital, convalescent home, or other institutional services, appliances and after-care as necessary for the treatment of the child. Appliances or other isolated parts of treatment are not purchased for a child by the state agency except as part of a comprehensive treatment plan for which the state agency is responsible.

"Officials of the Children's Bureau will be glad to join with you in studying any specific situations in which surgeons competent in orthopedic surgery are excluded from the crippled children's programs. In some states, of course, there are many more orthopedic surgeons than are required for providing the volume of service needed in the crippled children's programs."

Cooperative Medical Advertising Bureau

The Cooperative Medical Advertising Bureau continues to assist its present membership of 42 state medical associations through 34 state medical journals in securing advertising space sales and in servicing accounts by handling most of the details for the convenience of the journal offices.

Through its monthly bulletin, the Bureau offers helpful suggestions as well as current listings of products accepted by the Councils on Pharmacy and Chemistry, Physical Medicine and Foods and Nutrition. Acceptance of many products opens up an avenue of further prospects for the journals, all of which follow standards of advertising adopted for publications of the American Medical Association. It is, therefore, hoped to maintain present sales in subsequent years and even to increase them.

The net billing for the first nine months of the fiscal year, December 1947 through August 1948, amounts to \$427,817.26. Because of economic conditions, there were some curtailments in advertising appropriations, and therefore this figure lacks \$6,405.31 of the total amount for the same period of the previous year, or a decrease of less than 1.5 per cent. This is an average. Because of regional schedules, a few of the journals gained in revenue. Some enjoyed approximately the same revenue while the loss sustained by others exceed this percentage. The general trend of loss of other so-called "business papers" runs 6 per cent (in pages) for the period January through June 1948.

The trend for the remaining three months of this fiscal year indicates that the situation will not improve. However, the estimated total for the full year is \$570,532, and the average decrease will not exceed 2.5 per cent. The estimated total gain for 1946, 1947 and 1948 will approximate \$424,116, or an average gain of \$141,372 per year.

The total net billing for the past three years will approximate \$1,795,183.33, or an average of \$598,394.44 per year since the reorganization of the Bureau. Previous billing from 1913 through 1945 totaled \$4,909,356.23.

The Bureau, operating under the auspices of the Board of Trustees of the American Medical Association, functions in behalf of the state journal group, and all revenue is transmitted to the member journals, less the Bureau's operational costs which amount to about 6 per cent.

Office of Executive Assistant: Coordination and Public Relations

Substantial progress has been made in implementing the public relations program outlined in the report of the Office of the Executive Assistant which was submitted to the House of Delegates in June of this year.

The present report describes some of the newly launched activities that have won hearty approval from state and county medical societies and that have also received highly favorable comment from public relations journal and allied medical and health groups:

PR DOCTOR AND EXCHANGE

For a long time need existed for a specific medium through which public relations programs, ideas and achievements of state medical associations and the American Medical Association could be interchanged to the benefit of the entire medical profession. To fill this need, a periodical news letter and exchange, entitled the *PR Doctor*, was created. It is issued every two months at present, but expanding state medical association and county medical society programs may call for increased issuance.

The Secretary's Letter of Aug. 30, 1948, quoted some of the highly enthusiastic comments received from the profession after the first issue of the *PR Doctor* was mailed. Since that time there have been many additional commendations.

The *PR Doctor* is sent to the general officers of the Association, the members of the Board of Trustees, the members of the House of Delegates, the presidents, secretaries, journal editors, and public relations committee chairmen of state medical associations and a special list of leaders of key medical groups who have requested the news letter regularly. The headquarters

offices of state medical associations and of metropolitan county societies receive the *PR Doctor* news letter and, in addition, an accompanying kit of Exchange items described in the second half of the news letter. State associations in turn disseminate the PR information and ideas in this kit to their component county societies.

MEDICAL PUBLIC RELATIONS CONFERENCE

Reservations for the first National Medical Public Relations Conference, sponsored by the Office of the Executive Assistant, to be held in St. Louis on November 27, have exceeded original expectations. First invited were the chairmen of state medical association public relations committees, and executive secretaries and staff public relations directors of state associations. Since then the across-the-nation response has included reservations from presidents and other officers of state medical associations.

News about the Conference prompted such national organizations as the American Bar Association, American Dental Association, American Hospital Association, American Pharmaceutical Manufacturers Association and others to request special permission for their public relations leaders to attend. These requests have been granted.

Public Relations News, the outstanding weekly news letter of the profession, said, in commenting on the Conference, "Universality of PR techniques and their adaptability to all fields including the professions were never better illustrated than in the new program of the American Medical Association. The major project is preparation for the first Medical Public Relations Conference to be held in St. Louis November 27. Program will center around three basic topics: 'The Public Speaks on Health,' 'What Public Relations Did for Us,' and 'Yes, The Profession Needs Public Relations.'"

The theme of the Conference is "Shooting at Common Public Relations Targets." The need of such a definition and polarization of purposes was sharply emphasized by a survey of state medical association public relations objectives.

It is intended that the Conference become an annual event providing the public relations forum and personal get-together desired by public relations committee chairmen and staff of state medical associations.

PRESS RELATIONS

The gratifying response which the Press Relations Bureau has received from newspapers during 1948 indicates strongly that editors, reporters, feature writers, science writers and radio news commentators from every section of the country look to the headquarters office of the American Medical Association as a dependable source of information regarding medical matters. They have sought information and advice on every phase of the multiple activities of the Association and of the profession.

This Bureau, through its close contact with newspapers, magazines and radio stations, has succeeded in "killing" a great deal of inaccurate medical information. On many occasions inaccurate information regarding medical matters has been corrected in the process of publication, while in other cases such inaccurate information has been eliminated completely through the advice and services offered. Information favorable to the medical profession has often been added as a result of Press Relations activities.

Press Relations has worked closely with other Bureaus and Councils of the Association in matters pertaining to publicity, and its personnel has served as consultants on many occasions to medical groups seeking advice on publicity problems. For example, the officers and Council of the World Medical Association were assisted in handling publicity when 14 members of the Council, representing 12 different countries, held a four day meeting in New York, April 26-29, 1948. Much of the Council's business was carried in prominent stories in all of the New York newspapers and elsewhere.

Press Relations prepares and distributes the weekly news bulletin, *The American Medical Association News*, which contains official announcements of the Association and condensations of original articles and editorials appearing in *THE JOURNAL*, *Hygeia* and the special journals. This news release, containing material which may be reprinted or republished, is mailed to

1,300 newspapers, press association, magazines, radio stations, industrial house organs, medical journals and bulletins. Persons who receive this weekly news release have made specific voluntary requests for it.

The association's news releases have become a recognized medium for the dissemination of news pertaining to medical activities and medical progress. A casual perusal of a few magazines and newspapers indicates that there is a wide interest in articles on medical subjects.

The number of individual stories based on association news releases would run into the thousands. On the basis of clippings received in the headquarters offices, it might be said without exaggeration that American Medical Association stories have appeared in every daily and weekly newspaper in the United States during this year.

The association received splendid newspaper, news magazine and radio news coverage during the annual session held in Chicago in June. Sixty-three writers were registered for the session, including many of the nation's topflight science editors.

The Director of Press Relations has expanded his activities to include talks on "Fifty Years of Medical Progress," before a series of Kiwanis Club meetings in the Chicago area. His talks, which have been well received, outlined from a layman's point of view the many medical benefits which mankind has received during the last fifty years.

SECRETARY'S LETTER

The Secretary's Letter keeps officials of state and county medical societies informed about the activities of the American Medical Association and is mailed almost every week to more than 3,000 leaders in the medical profession. Its contribution to constituent state medical associations and component county medical societies is continually praised and commended. Many valuable inquiries and follow-ups are stimulated by its contents.

STAFF APPOINTMENT

The addition to the staff of Mr. William F. Doscher as assistant director of public relations has enabled the Office of the Executive Assistant to increase its services to the medical profession, has increased the amount of advice and guidance furnished to numerous state and county medical societies relative to setting up and operating medical public relations programs and has added to the number of special public relations events conducted by the Office.

FIELD SERVICE

Invitations to address and consult with state and metropolitan county medical societies on public relations matters are received from time to time during the year. Members of the staff participated in numerous conferences, discussions and meetings in 1948.

The Executive Assistant addressed medical society groups in Wisconsin, Minnesota, Nebraska, Washington and the New England states, and consulted with medical societies in California, Oregon, Oklahoma and Pennsylvania.

SPECIAL SERVICES TO COUNCILS, BUREAUS AND COMMITTEES

The services of the public relations office are available at all times to all Councils, Bureaus and Committees of the Association. Typical samples of events which were publicized and interpreted for the benefit of these groups and of the profession as a whole are:

1. *Spring Session of the Council on National Emergency Medical Service*.—A nationwide successful publicity campaign serviced 3,000 newspapers with a minimum of three different stories, teletyped and transmitted by Associated Press, United Press and International News Service; *Newsweek*, *Time* and the *Washington Report on the Medical Sciences* covered the session, and national broadcasts were made over the American Broadcasting Company's "Headline Edition" and the Mutual Broadcasting Company's "Mutual Newsreel."

2. *Civilian Amputee Program of Council on Industrial Health*.—The handless movie actor, Harold Russell, was invited to American Medical Association headquarters to pose for news and feature pictures to publicize the civilian amputee program of the Council. These, together with a story, appeared in the local press and were serviced nationally through Acme News-

pictures and the Newspaper Enterprise Association. Mr. Russell appeared on the American Medical Association television show, gave the Council's rehabilitation program a fine tribute and during his across-nation platform appearances will comment most favorably on the association's program.

3. Bureau of Medical Economics.—The public relations director of the National Safety Council was brought in, and his cooperation asked with reference to publicizing a new method of determining the leading causes of death. This new method, which was worked out by the Bureau, used the number of working years lost as a judging basis. Accidents were found to rank ahead of heart disease and cancer when this method was used.

4. Delegations.—Delegations from the World Medical Association and from Colombia were publicized through pictures taken by the American Medical Association public relations staff and supplied to newspapers.

MAGAZINE ARTICLES

The public relations department assisted directly and indirectly in helping create talked about articles favorable to the American Medical Association and to doctors in several nationally circulated magazines.

CORRESPONDENCE

The Public Relations office this year will answer nearly 3,000 letters dealing with medical public relations inquiries. This sizeable task involves requests from individual doctors, distinguished citizens, state and county medical societies, health agencies, the general public, students, business and industrial concerns and public relation organizations. The warm "thank you" letters received indicate that this service wins good will for the American Medical Association and the medical profession.

LIAISON WITH OPINION LEADERS

A continuing project has been started to cultivate and inform leaders in the various fields of public life, such as politics, education, government, law, the church, industry, labor, the press, radio, magazines, the armed forces, women's groups, motion pictures and the theatre.

The medical profession can never have too many friends among these varied American opinion leaders. For the most part, procedure is to meet and know these persons informally and to present the story of the achievement and public welfare goals of American medicine to them. Their stake in the continuance of a free medical profession is stressed; reception to date has been most encouraging and beneficial.

BUREAU OF INDUSTRIAL AND PERSONNEL RELATIONS

Since the presentation of the Bureau's last annual report to the House of Delegates in June 1948, the activities of the Bureau have expanded from the role indicated in the Functional Analysis of Personnel Program that was appended to that report.

In addition to previous duties, the Bureau has taken over the employment function. In accordance with employment requisitions furnished by Association departments needing personnel, the Bureau by various means, such as advertising and contacts with schools, residence halls and placement agencies, attempts to procure the personnel requested. Applicants for employment are screened by appropriate skill and aptitude tests and are referred to departments in accordance with requisitions on file. Obviously, the full benefits that are possible from the use of the tests in placement and utilization of the applicants can not be expected until such time as applicants substantially outnumber job openings. The tests so far, however, have screened out the incompetent, though the return of a more normal labor market must be awaited to exercise the selectivity that will be indicated by an adequate testing program.

To help ascertain the causes of labor turnover, the Bureau now conducts an exist interview with each employee leaving the Association's employ. An analysis of these interviews is expected to have practical as well as statistical advantages in planning future personnel policy. A report of labor turnover for the months of June, July and August 1948 shows that 159 applicants were interviewed, 65 tested and 118 hired. In the

same period, 130 employees were separated from the payroll. The latter total, however, can be discounted by the fact of 32 separations in the Varsity Department, the operations of which were cut radically when the work stoppage in the composing room ended June 27, and of at least 25 separations due to part time summer employees returning to school.

The aforementioned employment activities have been superimposed on the activities that were set out in some detail in the previous annual report. Those activities may be summarized as follows:

1. Continuance by job evaluation studies and performance rating to act in an advisory capacity as to equitable salary adjustments for "ordinary" office personnel.

2. Preparation of an employee's manual, which should be ready for release by December 1.

3. Preparation of an organization manual for the Association to indicate functions of departments and flow of work therein.

4. The formation, with the help of an advisory committee of certain Association executives, of a vacation policy in keeping with existing personnel practice of what are believed to be progressive organizations.

5. Participation actively in the installation and supervision of the varsity operation that was used in the publication of THE JOURNAL during the work stoppage in the composing room.

6. Negotiations with seven unions whose contracts either have expired or are about to expire.

7. Improving and installing modern personnel records to conform to Association needs in visible index form, including (a) modern application form for employment, (b) authorization to Comptroller to pay, (c) listing of applications of all employees in alphabetic sequence and by departments with collateral cards indicating salary history, job classification, performance rating and (d) a listing by job classifications.

8. Devising and preparing periodic reports, such as a monthly employment log, turnover report, application register, exit interview analysis, monthly wage and salary administration control report and a quarterly chartual presentation of salary grades, number of persons therein and job averages in light of area averages.

9. Studies in modern personnel administration.

10. Consultation with employees concerning personal problems affecting job performance.

11. Processing of employee grievances.

As has been stated in the previous annual reports submitted by this Bureau, the personnel program of the Association will be subject to future evolution and development as future appraisals and experience indicate the practical needs of the Association.

Council on Pharmacy and Chemistry

Since the last report was made to the House of Delegates at the Chicago Session in June, the Council on Pharmacy and Chemistry has continued to pursue its objectives relating to the advancement of research and therapeutic measures and any other activities for which this body has become renowned.

RESEARCH

A number of grants-in-aid have been issued under the auspices of the Committee on Therapeutic Research, a standing committee of the Council. These grants are intended to assist research workers in the study of various therapeutic problems. The Council was responsible for considerable research on the part of those interested in the development and distribution of new drugs and technics by examining the proposals, asking searching questions and demanding factual information. In addition, many conferences have been held in the Council office with individual research workers, with representatives of research organizations and with representatives of organizations interested in industrial efforts. Furthermore, information intended to acquaint interested parties with the latest information and to point research investigations toward research objec-

tives that provoke sound scientific facts was disseminated from the Council office in Council reports and by members of the headquarters staff to medical and allied groups.

THERAPEUTIC TRIALS COMMITTEE

The Therapeutic Trials Committee, another standing committee of the Council, has pursued its work of encouraging research in fields in need of exploration and of assisting collaboration to reduce to a minimum unnecessary repetition of research efforts and to bring together those who have new ideas or products and those who are qualified to undertake the necessary investigations. An outstanding example of the Committee's efforts is the collaborative project that it has initiated for the study of the effect of estrogens and endrogens on cancer. Participating in this project are fourteen pharmaceutical firms that have been donating drugs, forty-eight investigators and other interested organizations such as the American Registry of Pathology at the Army Institute of Pathology. A progress report of the Therapeutic Trials Committee has been prepared for presentation to the Council and will be published in *THE JOURNAL* in the near future.

PUBLICATIONS AND REPORTS

Council-sponsored publications, including "New and Non-official Remedies," "Useful Drugs," and the "Epitome of the Pharmacopeia of the United States and National Formulary," which have become standard reference books in medical and pharmaceutical schools, in hospitals and elsewhere continue to enjoy popularity, and thousands of these books have been distributed. Recently the "Annual Reprint of the Reports of the Council on Pharmacy and Chemistry" for 1947 was made available. In addition, there was released for distribution the "American Medical Association Interns' Manual," prepared by Councils and Bureaus of the American Medical Association and compiled and edited in the office of the Council on Pharmacy and Chemistry.

The Council also continues to pursue its policy of publishing various reports of interest concerning the prevention and treatment of disease and to make available reprints of these articles as requested by physicians and others with mutual interests.

"ACCEPTANCE" OF DRUGS

The acceptance program of the Council encourages the submission of many drugs, so that the manufacturers may use the Council seal. This represents one of the major activities of the Council and requires the maintenance of a well equipped laboratory at Association headquarters. Many outstanding authorities were consulted by the Council as the drugs were being considered. As the products were accepted, statements of actions, uses and dosage were prepared for publication in *THE JOURNAL* and eventual transferal to "New and Nonofficial Remedies."

MEETINGS

In addition to several committee and subcommittee meetings, the Council held its annual meeting on Nov. 12, 1948. The Therapeutic Trials Committee met on the preceding day. Details of these meetings will appear in an early issue of *THE JOURNAL* and will be abstracted in the 1949 annual report to the House of Delegates.

COLLABORATION

The Council and its office personnel continue to work closely with many agencies, governmental and nongovernmental. It has also worked closely with other departments at the headquarters offices where there were problems of mutual interest.

EXHIBITS

Exhibits prepared under the auspices of the Council have been popular and in demand by a number of societies and associations. Usually a representative of the Council office accompanies the exhibit to answer questions and to explain in detail the work of the Council and other Association offices.

FIELD SERVICE

Members of the headquarters staff continue to receive requests to appear before scientific and lay groups to discuss topics which fall within the purview of the Council. The Secretary and assistants at the Council office and members of the Council hold membership in a number of committees with varying interests, which permits active representation where indicated.

QUACKERY

The Council and the Bureau of Investigation have increased the tempo of their investigations of questionable practices, so that proper attention may be focused on frauds and charlatans and the chicanery which they promote. Articles on these activities have appeared from time to time and will continue to appear. In addition, where indicated, the facts are brought to the attention of the proper authorities.

TOXICOLOGIC PROBLEMS

Because of the harmful results that may follow the use of highly potent drugs and because of the accidents that have occurred with other preparations, the Council is expanding its interest in toxicologic problems so that proper warnings and other information will be available in time of need. An indication of this interest is seen in the joint enterprise undertaken by the Council on Pharmacy and Chemistry and the Council on Foods and Nutrition in the study of pesticides, a group of compounds which may present real hazards unless properly controlled.

LEGISLATION

The Council presents its information on therapeutics and allied measures and the benefit of its experience to those who are interested in health measures advocated by federal or state bodies. Such information usually is forthcoming on request from an interested individual or body, but often it stems from an action initiated at headquarters by another office, such as, for example, the Bureau of Legal Medicine and Legislation.

RECOMMENDATION FROM HOUSE OF DELEGATES

The report of the Reference Committee on reports of the Board of Trustees and Secretary, which was adopted by the House at the 1948 Annual Session, stated in part:

The reports of the councils and laboratories indicate, as they have in the past, the abundance and excellence of their diversified accomplishments. The committee recommends that some method of furnishing information on the work of the councils and laboratories to the rank and file of the membership be studied. Your committee believes that information about the accomplishments of these departments of the Association gains for the Association improved understanding and cooperation from the membership.

Steps have been taken to implement this recommendation.

Chemical Laboratory

Since the first of the year the Chemical Laboratory has been mainly occupied in carrying out its primary function of examining drugs and pharmaceuticals and establishing tests and standards for several of the products submitted to the Council on Pharmacy and Chemistry. Some of these products were promethestrol, methionine, methapyrilene hydrochloride, thonzylamine hydrochloride and methaphenilene hydrochloride. Certain of these demanded rather extensive investigation. The question of appropriate names for several new drugs has been considered in cooperation with the Council's Committee on Nomenclature.

Considerable time has been spent editing the tests and standards section of the forthcoming N. N. R., and the Director has been active in arrangements for the scientific meetings at the Chicago Session. One of the staff organized and presented a scientific exhibit for the Laboratory depicting the relationship of chemical structure and pharmacologic action at the annual session. The staff has been active in developing plans for the proposed expansion of the Laboratory.

The Laboratory has continued its function in the consideration of products or devices submitted to other departments when chemical examination or advice was thought desirable. An example was the examination for the Bureau of Investigation of the Zerret-Applicator, a quack device. It has advised the editorial and advertising departments in chemical matters and has aided the Library in indexing certain chemical products for the Quarterly Cumulative Index Medicus.

Several books have been reviewed for publication in *THE JOURNAL*, and numerous letters of inquiry have been answered. A system of classification is being set up for the books maintained in the chemical library used by the Division of Therapy and Research.

Council on Physical Medicine

The Council on Physical Medicine has continued actively its assigned duties of investigating apparatus, instruments and methods for therapy and diagnosis offered for sale to the medical profession. Thus, the Council aims to protect the physicians and the public against fraud, misrepresentation, inefficiency and objectionable advertising in connection with apparatus and physical methods recommended for medical purposes.

Since January 1948 approximately 118 pieces of apparatus have been submitted for consideration. Fifty-one reports of acceptance and three reports of nonacceptance were published in *THE JOURNAL* this year. Among the devices considered were whirlpool baths, diathermy, contraceptives, hearing aids, baby incubators, ultraviolet lamps, metabolism apparatus, oxygen tents, gynographs, electric impulse stimulators, inhalation pumps, radium applicators, colonic irrigators, pyrometers, sitz baths, electro-surgical units, germicidal lamps, resuscitators, audiometers, respirators, stethoscopes, appliances for relief of allergenic disturbances, infra-red lamps, vaporizers and elastic hose.

PUBLICATIONS

The booklet "Apparatus Accepted" is being revised, and it is expected that a new edition will be printed during the coming year. Six articles were published: Experimental Production of Cancer of the Skin by Ultraviolet Radiation, Tinted Lenses, Intermittent Positive Pressure Breathing, Microwave Radiations, Acceptance of Ultraviolet Lamps for Disinfecting Purposes (Present Status), and Resuscitation.

ATOMIC ENERGY

The Council has sponsored an exhibit on atomic energy at six medical meetings. It is scheduled for at least five additional meetings before the end of 1948. The two pamphlets "Glossary of Terms Used in Atomic Energy and Nuclear Physics" and "Primer of Questions and Answers Relating to Medical Applications of Atomic Energy" were printed this year and have been distributed widely since the Annual Session of the American Medical Association in June.

ARTIFICIAL RESPIRATION

The Council cooperated with the American National Red Cross in the publication of a joint article entitled "Resuscitation," which appeared in *THE JOURNAL*.

COUNCIL CONSULTANTS

Physical medicine embraces many branches of the healing art. In view of the wide scope, the Council is fortunate in having the expert advice of groups of consultants which have been appointed to advise the Council in specialized fields.

American Health Resorts.—A meeting was held in Chicago at the time of the Annual Session of the American Medical Association at which four members were present. A list of health resorts which are under medical direction are being compiled. Two papers are being prepared on the subject of health resorts. There will be a small exhibit on the subject at the Interim Session of the Association in St. Louis, November 30 to December 3.

Artificial Limbs.—A new group of consultants has been appointed. A meeting was held at the time of the Annual Session of the American Medical Association in Chicago in June. It was decided that the group would prepare two booklets, one for the surgeon and another, less expensive, for the patient.

Audiometers and Hearing Aids.—Thirty-two hearing aids were presented to the Council for consideration; two have been accepted and the remainder are still being investigated. Five audiometers have been submitted, but none of the reports on them is complete. The article "Rebates" has been adopted for publication.

Contraceptive Devices.—One meeting was held in Chicago in June at the time of the Annual Session. The revised "Requirements for Acceptance of Contraceptive Devices" have been adopted. Five devices were submitted for consideration, but the reports are not complete.

Education.—At a recent meeting of this group, the Committee on Education of the American Congress on Physical Medicine

requested closer cooperation with the Council through the consultants.

Electrocardiographs.—Six devices were submitted to the Council during the year. Two reports of acceptance were published in *THE JOURNAL*. One meeting was held in June, at which time revisions of the "Minimum Requirements for Acceptable Electrocardiographs" were discussed and made.

Electroencephalographs.—"Minimum Requirements for Acceptable Direct Reading Electroencephalographs" were adopted by the consultants and referred to the Council members for adoption. One meeting was held in Chicago in June. To date, no electroencephalographs have been submitted to the Council for consideration.

Ophthalmic Devices.—A new group of consultants has been appointed. A meeting is scheduled for October.

Respirators.—The Consultants have recommended to the Council the acceptance of two cuirass type respirators and recommended the rejection of one.

Röntgen Rays and Radium and the Medical Aspects of Atomic Energy.—This group had one meeting in Chicago in June. An article on "Radiation Hygiene" has been adopted by the consultants and by the Council for publication. The consultants have given careful consideration to radon ointments and radium applicators.

The year 1948 showed an increase in the work of the Council, apparently because of more interest in physical medicine by the profession and public. An extensive correspondence with manufacturers of equipment was necessary in an effort to clarify criticisms of the devices. Improvement in function, efficacy and reliability of apparatus in many instances was suggested by the Council.

The Council on Physical Medicine has continued its cooperation with governmental and private investigative agencies, as, for example, the Food and Drug Administration, Federal Trade Commission, Federal Communications Commission, National Bureau of Standards, national and city Better Business Bureaus, American Standards Association and the Underwriters' Laboratories.

Cordial cooperation has been maintained with the American National Red Cross, the Infantile Paralysis Foundation, the American Congress of Physical Medicine and the American Hearing Society.

Council on Foods and Nutrition

An important public health problem, created by the rapid introduction of a great number of new synthetic organic pesticides, was called to the attention of the profession in a statement adopted by the Council on Foods and Nutrition on June 26, 1948, and published in *THE JOURNAL* Aug. 28, 1948. These pesticides, developed for the most part since World War II, are now widely used in agriculture for the combating of insects and other pests. Their use creates potentially grave public health hazards, since toxic residues may find their way into foods. There is an appalling lack of factual data concerning the effect of these substances when ingested with food. The pathologic effects on man of the ingestion of small amounts of these substances over prolonged periods are entirely unknown. While recognizing the great potential usefulness of the pesticides in agriculture, the Council also recognizes the hazards of careless use.

The Council has had full support and help from the Council on Pharmacy and Chemistry in the study of this problem.

The recognition of the fact that foods and beverages are being increasingly exposed to possible contamination with the residues of chemical technologic aids used in their production may well be the beginning of a new era in the science of foods and nutrition as it concerns the physician. The profession has long recognized that foods must be free from bacterial contamination and that they must both contain and retain essential nutrients. The development of a multitude of new chemical technologic aids now makes it necessary to insist that foods be free from toxic residues.

To assist in keeping the profession informed of advances in the science of foods and nutrition as it relates to the health and

well-being of the people is the central purpose and reason for the Council's existence.

The "Handbook of Nutrition," a collection of selected papers by authorities in the field, is nearing completion.

The following data are illustrative of other recent activities of the Council.

Since cheese is an important article in the American diet and since it is recognized that cheese made from unpasteurized milk can and does account for certain epidemic diseases in man, the Council has indicated its intention to encourage the producers of cheese to take the necessary steps for the control of this source of infection.

Concerning the multiple vitamin fortification of the general milk supply, the Council endorsed the statement by the Food and Nutrition Board of the National Research Council (to be published). The Council issued a statement concerning the fortification of whole milk with vitamin A in which it was indicated that the Council could see no public health advantage to the supplementation of the normal vitamin A content of whole milk.

The Council has taken steps to encourage the production of fruit juices containing high natural levels of vitamin C. The fortification of fruit juices with ascorbic acid and thiamine has been proposed, but the Council has not accepted such juices.

One large group of manufacturers of ice cream has indicated its desire for Council support of a study of ways and means of improving the nutritive content of ice cream. The Council voted to encourage this project and plans to set up a committee for the consideration of the results of this investigation.

The status of the nitrogen trichloride treatment of flour ("agene" treatment) has been carefully followed.

The wider use of vitamin D through the extension of the use of vitamin D milk is in part due to the efforts of the Council. Currently the number of accepted brands of vitamin D milk exceeds 1,100.

The primary reason for the formation of the Council was to prevent or discourage false or misleading advertising claims in the promotion of foods. This is still one of the important functions of the Council. Annually, the Council reviews advertising copy worth several million dollars.

The services of the Council are given to many inquirers, among them physicians, laymen, manufacturers and governmental and private agencies.

The Council continues to have the cooperation of the food industry. For its cooperation and for the help of many interested groups, the Council is most appreciative.

Bureau of Investigation

For the period from Jan. 1, 1948 to Aug. 31, 1948, the Bureau of Investigation answered a total of 2,457 inquiries. This total was about evenly divided between members of the medical profession and other persons. The latter group included students and teachers, laymen, Better Business Bureaus, government agencies and newspapers and magazines.

The Bureau also contributed six columns of reports for inclusion in *THE JOURNAL* and collaborated with the Council on Pharmacy and Chemistry in a report exposing the promotion of a nostrum for bust development.

From the point of view of interest, the largest volume of correspondence was received because of the promotion of Dr. William F. Koch and his method of treatment for cancer by United States Senator William Langer of North Dakota. Senator Langer had caused a reprint from the Congressional Record for June 7, 1948, to be distributed, under his frank, to physicians throughout the country. A report covering one aspect of this promotion appeared in *THE JOURNAL* for Aug. 7, 1948.

The Director of the Bureau attended the trial in federal court at Fort Wayne, Ind., of the brothers Peter and Charles Kaadt of South Whitley, Ind., who had been dispensing vinegar and saltpeter and their own peculiar brand of hospitality instead of insulin and/or diet for diabetic patients. A report of this activity appeared in *THE JOURNAL* for May 22, 1948.

The Bureau is actively engaged in the gathering of information from the many sources available to it. It earnestly seeks

the cooperation of all members of the profession, as well as of the state and local medical societies, in the gathering of this information. It is intended to publish a greater volume of reports by the Bureau on subjects attaining national interest.

Council on Industrial Health

The regular activities of the Council on Industrial Health have continued along the lines discussed at some length in the last report under the general headings of public relations, professional organization, education and scientific development, preparation of standards and rehabilitation. Major developments since June 1948 have occurred in the fields of workmen's compensation, emergency medical service and plans for the next Industrial Health Congress.

ANNUAL CONGRESS ON INDUSTRIAL HEALTH

The National Health Assembly held in Washington last spring contained no panel on industrial health. An effort was made to include it, although without enthusiasm. The Council now plans to conduct its next Annual Congress in a manner to make up for this omission. According to present plans essential problems will be stated and discussed in panels devoted to public relations, medical administration, environmental hygiene, medical-hospital services, health education and preventive medicine. These plans have met with approval by the other departments in the American Medical Association whose activities touch on employee health problems. The Division of Industrial Hygiene in the Public Health Service will act as a co-sponsor and other professional groups will be invited to participate. The House of Delegates has previously expressed its approval of joint planning for industrial health by management, labor and medicine. If the next Congress discovers useful ways of working together, a notable contribution to the advancement of industrial health and medicine will be made.

WORKMEN'S COMPENSATION

Several years ago the House of Delegates approved of participation by the Council on Industrial Health in a National Workmen's Compensation Conference under the aegis of the International Association of Industrial Accident Boards and Commissions. The International Association has withdrawn its support in favor of greater activity on the part of its own committee organization. The Committee on Workmen's Compensation of the Council has been so impressed by the useful contacts set up in this National Conference that steps have been taken to preserve them. Consultants are to be appointed representing the administrative, legal, insurance and technical aspects of workmen's compensation. The Directors of the Bureau of Legal Medicine and Legislation and the Bureau of Medical Economic Research have been invited to serve as members of the consulting committee. The work of the committee will embrace general surveys of medical relations in workmen's compensation, field visits to industrial commissions and insurance organizations, attendance at appropriate meetings, preparation of educational material, consultation services to state and other medical organizations, collection of data for special presentation to the profession and the necessary steps to improve treatment of compensable disability, disability evaluation and medical testimony. Dr. C. O. Sappington, whose experience and writings in industrial and compensation medicine are well known, has agreed to act as executive director of the Committee on Workmen's Compensation on a part time basis.

CIVIL DEFENSE AND INDUSTRY

Soon after the Council on National Emergency Medical Service was formed, its attention was called to the desirability of effective liaison with the Council on Industrial Health in order that conservation of industrial medical personnel through proper training, recruitment and distribution should occupy a prominent place in joint deliberations. The purpose of this liaison is to make available all permissible information dealing with preparedness and national security to the industrial medical and allied professions and to profit by past experience. In the event of atomic bombing industrial physicians and allied technicians represent a group accustomed to measure and control toxic

exposures. Industry will be the primary object of attack, and many changes will occur in the conduct of war plant operations and in the mobilization and use of the labor forces. There is need for intelligent preliminary planning to define the newer functions of industrial health as they relate to a national emergency, to integrate them with other measures designed for civil defense and to give industrial health a measure of authority in planning and administration in proportion to its responsibilities. These considerations have suggested that the Council on Industrial Health take the initiative in working out the details of industrial medical requirements under national emergency conditions.

The Council therefore has appointed a Committee to act as its consultants on the industrial medical aspects of civil defense. The membership is nearly identical to that of a committee serving in a similar advisory capacity to the Procurement and Assignment Service and the National Security Council during World War II. At its organization meeting the Committee determined that the principal problems had to do with the classification of the labor force according to physical capacity; the special health problems of women, the overaged and the handicapped; recruitment and training of industrial physicians, nurses and technicians; the training of industrial medical personnel regarding special missiles and new materials; the proper integration of industrial medicine with other elements in community civil defense planning, and the problem of nutrition in relation to fatigue and productive capacity. Subcommittees have these matters under consideration. A second meeting was held in Washington with representatives of the Armed Services, the National Security Resources Board, the Munitions Board, the Office of Civil Defense and the Brookings Institution. Material is in preparation which will alert the industrial medical profession with emergency and civil defense arrangements. Liaison is being organized with appropriate governmental agencies and with the engineering, chemical and nursing professions. The next meeting of the Consulting Committee will be held jointly with the Council on Industrial Health at Wright-Patterson Air Base in Dayton, Ohio, to permit inspection of and knowledge about the aviation and occupational medical services of the Air Force.

Council on National Emergency Medical Service Council Activities

During the interval since the last report of the Council on National Emergency Medical Service the concept of its obligations to the profession has been further crystallized. Specifically, an educational program to alert the profession at large to the magnitude of the international dilemma with the accompanying medical implications is essential. To this end an increased number of editorial items, comments and the like have appeared in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION. It is believed that emphasis in this direction has increased the understanding on the part of physicians of the problems now at hand.

A number of conferences and meetings of the Council have been held. As a result the American Medical Association continues to be identified among those groups that are urging on the President of the United States and the various agencies of the government, including congressional committees, the pressing necessity for continued development of policies, procedures and programs concerning the coordination and study of the numerous problems of a medical, health and sanitary nature involved in mobilization of the nation's manpower, resources and materials in the broadest terms and at the highest level.

FULL TIME SECRETARY APPOINTED

Dr. Harold R. Hennessy has been appointed to the newly created office of full time Secretary of the Council. He was formerly a member of the staff of the Council on Industrial Health. Dr. Hennessy, who received his M.D. degree from the University of Minnesota Medical School, practiced in California prior to 1940. During World War II he held several assignments in this country and overseas, the last being in

the Office of the Surgeon, Fifteenth United States Army. At the present time he holds an Army Reserve Commission with the rank of colonel.

FOR THE YEAR AHEAD

The Council on National Emergency Medical Service, during the coming year, plans to utilize as fully as possible the numerous facilities of the American Medical Association to effect a timely, logical and orderly integration of the medical profession into the national security program.

Responsibility will be carried out through coordination in the constituent medical associations, with extension therefrom into the component medical societies. The Council, its consultants and the full time staff will be concerned with over-all policies and coordinations within and without the structural framework of the Association.

Thus, it is clear that for the year ahead the profession may anticipate aggressive national security medical programs implementing the principles as amended and adopted by the House of Delegates at the Chicago Session in June 1948.

The Council clearly recognizes that modern military activity depends basically on efficient and coordinated industrial production. It realizes that, if America is to keep her position of world leadership, every effort should and must be made to maintain the health and productive efficiency of her workers at a high level. Therefore, the medical personnel needs of industry, to insure the production of a sufficient number of planes, ships, tanks and guns are of prime interest to American medicine. In a similar way the personnel needs of agriculture and the civilian population at large must be weighed against the serious and pressing demands for physicians made by the armed forces. Planning and active coordinations along these lines are now in progress.

The effective number of available physicians in the United States is a valuable and relatively fixed human resource which cannot readily be increased. Therefore, this Council will continue to subscribe to the concept that strict economy in the use of professional personnel should and must be continued as one of the keystones in our nation's effort to secure the peace of the world.

The fine cooperation extended by individual physicians and concerned organizations has been most heartening, and the Council looks forward to the privilege of rendering increased constructive service to the profession, the armed forces, industry, agriculture and the public at large.

Bureau of Legal Medicine and Legislation

This report covers, in the main, only the period between the annual session of the House of Delegates held in Chicago in June and the date of its preparation, October 1.

REVISION OF STATE MEDICAL PRACTICE ACTS FOR AMERICAN MEDICAL DIRECTORY

In each edition of the "American Medical Directory" there are published the medical practice acts of the several states, which are kept up to date for the Directory by the Bureau. The last edition of the Directory was published in 1942. During the intervening period, there have been numerous amendments to state licensure laws and the Bureau has now completed a revision of these laws, as amended through the legislative year of 1948, for inclusion in the forthcoming Eighteenth Edition of the Directory.

THE EWING REPORT

On September 2, a report to the President by Oscar R. Ewing, Federal Security Administrator, was released, outlining a ten year national health program. It is understood that comments on the contents of this report will be submitted to the House of Delegates in some detail by other departments of the Association. The report suggests essentially the enactment of the compulsory medical care program under federal direction that has been proposed by the several editions of the Wagner-Murray-Dingell bill plus a gradual federalization, through subsidies, of medical education, of dental education, of nursing

education, of hospital maintenance and operation, of persons functioning in the field of public health, of research workers and of other personnel and facilities considered by Mr. Ewing to be necessary to make effective the program outlined in his report.

Copies of this report have been sent by the Bureau to each state medical association.

FOOD, DRUG AND COSMETIC LAWS

A recent important development should be reported briefly. There has been created in the American Bar Association's Section on Administrative Law a Committee on Food, Drug and Cosmetic Law. The creation of this committee followed the establishment in 1945 by the New York State Bar Association of a Section dealing with the same subject.

The American Bar Association committee, which held its first meeting in Seattle on September 6 of this year, will give continued study to both federal and state laws controlling the marketing of food, drugs and cosmetics and will from time to time suggest such amendatory legislation as the committee may deem to be needed.

The Chairman of the Committee, Charles Wesley Dunn, Esq., New York City, who occupies a similar position on the comparable Section of the New York State Bar Association, suggested in his first presentation to the Committee a number of amendments which will be given further study by the Committee.

The Director of the Bureau has accepted an invitation to become a charter member of the Committee.

NATIONAL MEDICOLEGAL ASSOCIATION

Reference was made in the report of the Bureau submitted to the House of Delegates last June to the fact that consideration was being given to the organization of a national association to promote a better development of legal medicine in the United States and to the publication of a periodical devoted to that subject. A meeting has been called of a steering committee to be held in New York City, October 18 and 19, where further consideration will be given to these proposals. The Chairman of the Association's Committee to Survey the Relationship of Medicine and Law, Dr. Alan R. Moritz, and the Director of the Bureau have accepted membership on the steering committee and will attend the New York meeting. The Director of the Bureau will also represent the American Bar Association at this meeting. Preparatory to the meeting, the Bureau has communicated with each state medical association to obtain reactions to the proposals and to date the response has been very gratifying and helpful.

SCOPE OF OSTEOPATHY

Court decisions by the supreme courts of three states have within recent months determined the scope within which osteopaths may legally function. A Pennsylvania case¹ involved the right of an osteopath to issue certificates of commitment to state institutions under the mental health act. The court held that an osteopath has no such right because he is not a "qualified physician" licensed to practice medicine in the state within the meaning of the mental health act. In a North Carolina case² the Supreme Court declared that osteopaths could not use drugs and that the phraseology used in the act under which they are licensed, authorizing them to practice "as taught by the various colleges of osteopathy recognized by the North Carolina Osteopathic Society" did not confer on them any right other than to practice osteopathy. The court said that the osteopathic colleges could not change the law of North Carolina nor widen the scope of the osteopath's certificate so as to permit him to practice other systems of healing by the simple expedient of varying their curricula. An Arizona case,³ decided in 1947 but recently abstracted in *THE JOURNAL*, involved the right of an osteopath to practice optometry. The Supreme Court of the State held that the osteopath was legally entitled to practice optometry.

1. *Palmer v. O'Hara, Secretary of Welfare, et al.*, 58 A (2d) 574; abstracted, J. A. M. A. 137:1553 (Aug. 21) 1948.

2. *State v. Baker*, 48 S.E. (2d) 61; an abstract will appear in an early issue of *THE JOURNAL*.

3. *Gates v. Kilcrease*, 188 P. (2d) 247; abstracted, J. A. M. A. 137:1079 (July 17) 1948.

In *THE JOURNAL* for April 10, 1948, there appeared an editorial referring to a then pending case in Kansas brought by a number of osteopaths before a three judge federal court against the governor and the attorney general seeking to restrain them from enforcing the section of the osteopathic act dealing with the scope of practice, as construed by the State Supreme Court, on the ground that that section, as construed, was discriminatory and violative of their rights under the Constitution of the United States. The decision of the Supreme Court of Kansas involved in this case held that a license to practice osteopathy authorized the practice of manipulative surgery and did not authorize the prescribing or administration of drugs as remedial aids. Testimony has been taken in this case, and briefs have been filed on behalf of both the plaintiffs and the defendants. The matter is now before the three judge federal court, and a decision is expected shortly. An appeal lies direct to the U. S. Supreme Court from the decision of the three judge court, whatever that decision may be.

STATE LEGISLATION

A summary survey of legislation of interest to physicians, enacted between July 1, 1947 and June 30, 1948, has been completed and will be published in a forthcoming issue of *THE JOURNAL*. It would unduly prolong this report if an extended reference were made to the state laws summarized in this survey, but it may be of interest to refer to some of the more important laws enacted.

A law was enacted in Virginia requiring a permit from the State Corporation Commission before any agency may solicit funds in the state for medical care programs. To assist the Commission in reviewing applications for permits, an advisory board has been created composed of seven members, one of whom is a representative of the Medical Society of Virginia. This law stems from a resolution adopted by the legislature in 1946 creating a commission to make a study of the activities of private groups seeking funds from the public for various phases of medical care. The State Division of Statutory Research and Drafting was assigned the responsibility of collecting for the Commission basic information and that Commission sought the assistance of the Bureau.

A law was enacted in Kentucky providing from the certification as "certified psychologists" of persons qualifying before a board of examiners in psychology. Similar laws had previously been enacted in Connecticut and in Virginia.

Laws providing for the licensure of practical nurses were enacted in Louisiana, New York and Rhode Island. Nursing scholarships were created in Mississippi and Virginia.

A law was enacted in South Carolina placing on a prescription basis the sale of the sulfonamide drugs, aminopyrine, thyroid and any other drugs declared to be "dangerous drugs." A similar law was enacted in Massachusetts with respect to amphetamine, barbituric acid and any other drug deemed by the department of public health to be a "harmful drug."

Laws providing for the licensure of hospitals were enacted in Massachusetts, Mississippi and Wyoming. Enabling acts under which prepayment medical service plans may be organized were passed in Mississippi and in South Carolina.

In Massachusetts, a special commission was created to consider the advisability of licensing institutions engaging in animal experimentation and to consider the advisability of supplying such institutions with unclaimed animals held in public pounds.

A New York law provides for the establishment of a state university and the creation of two health and medical centers as a part of it. Another New York law authorizes state aid to medical schools, research centers and similar institutions carrying on special training or research programs pursuant to contracts with the state university.

In South Carolina, eight scholarships were established at the state medical college, valued at \$75 a month plus tuition, and conditioned on the recipient's promising to engage in private practice for one calendar year for each year of the scholarship in some rural community in the state designated by the state board of health.

Arizona and Louisiana enacted hospital survey and construction acts and New Jersey created a commission to survey the state's voluntary charitable hospitals. In South Carolina, a law was enacted directing the state board of naturopathic examiners to undertake an immediate study of the licenses previously issued by that board.

In Virginia a senate joint resolution was enacted creating a commission to study medical education in general. In the words of the joint resolution, "the commission shall consider the costs and needs of medical education and the relationship of medical education to the services that it renders and the needs of the people, particularly in rural areas." The commission is to report to the legislature not later than Sept. 1, 1949.

AN EXAMPLE OF COOPERATION

The Executive Secretary of the Medical Society of the State of North Carolina, Mr. James T. Barnes, on his own initiative recently had sent to the Bureau a complete set of briefs filed in cases pending before the Supreme Court of that state involving the question of fees allowable to physicians who treat workmen's compensation cases. It has been previously reported that the Bureau maintains a Brief Library pertaining to numerous medicolegal issues. The more comprehensive this Library becomes, the better the Bureau will be able to serve. Other state medical associations are urged to keep the Bureau in mind if important court decisions arise in their states involving medicolegal issues.

INCOME TAX DISCRIMINATIONS AGAINST THE PROFESSIONS

Reference was made in the report of the Bureau submitted last June to several tax proposals then being made to remove some of the inequities in the federal income tax laws as they relate to professional persons.

These proposals in effect would permit individual proprietors and partners to provide from earned income for their retirement, the sums expended being excluded from taxation during the year expended but taxable during the period when the benefits of the retirement plan are received. Stated differently, the incidence of the tax on this income would be shifted from the year of earning to what is in most cases the year of spending. The House of Delegates instructed the Bureau to keep in close touch with this development. This it has done.

These proposals were considered by two sections of the American Bar Association at its 1948 meeting in Seattle, the Section on Corporation, Banking and Mercantile law and the Section on Taxes. The two sections failed to agree on a mutually satisfactory proposal to attain the objective and consequently the matter was not given consideration by the House of Delegates of the American Bar Association. It is anticipated that additional consideration will be given this matter at the midwinter meeting of the House of Delegates of that association.

In the meantime two programs have been scheduled in Chicago to discuss these tax proposals, one by the Committee on Federal Taxation of the Chicago Bar Association to be held on October 27 and the other by joint committees of the Chicago Medical Society, the Institute of Medicine of Chicago and the Chicago Bar Association on November 16. The director of the Bureau of Medical Economic Research, Dr. Frank G. Dickinson, will participate in the latter program.

The Bureau has secured material explanatory of these proposals for distribution to state medical associations so that the principles embodied may be studied prior to the convening of the Eighty-First Congress.

It is not recommended that the House of Delegates take any further action in connection with this matter at the present time.

IN BRIEF

A member of the staff of the Bureau, Mr. George E. Hall, has recently accepted membership on the Executive Committee of the Committee on Tests for Intoxication of the National Safety Council. During the summer, Bureau memoranda have been prepared or revised dealing with Blood Grouping Tests in Disputed Paternity Cases, Injunction and Quo Warranto to Restrain the Unlawful Practice of Medicine, Scope of Oste-

opathy, and Malpractice Actions for Death or Injury Following Administration of Anesthetics. A memorandum nears completion which will contain reference to the laws that have been enacted restricting the use of the title "Doctor" by requiring that in connection with its use there appear some descriptive phraseology indicating the type of practice the licensee is authorized to pursue. Arrangements are under way for a program on the relationship of physicians to the law to be presented at the Atlantic City session in 1949. . . . A reference is made in the report of the Secretary of the Association to a study under way by the Bureau concerning the corporate practice of medicine. This study is under the immediate supervision of Mr. Edwin J. Holman, a member of the Bureau staff. . . . The Director of the Bureau has been designated as a consultant to the Committee on Workmen's Compensation of the Council on Industrial Health. A communication has been received from the Professor of Medical Jurisprudence at Osmania University, who is also doing medicolegal work as coroner of the Hyderabad State, India, requesting information as to the sources in the United States from which he may obtain information concerning the application of science to criminal investigation. This information was furnished to the physician by the Bureau. A very important investigation has been concluded in New York concerning the scientific basis for the chiropractic concept of the causes of disease and the chiropractic technic used to effect a cure. This study was made by a commission appointed by the Subcommittee on Cults of the Council Committee on Legislation, Medical Society of the State of New York, and the commission was composed of the Professor of Anatomy, Syracuse University College of Medicine, the Pathologist at White Plains Hospital, White Plains, New York and the Professor of Biophysics, Cornell University.

Bureau of Health Education

In order to conform with the change in Association policy whereby reports are now presented to the Interim Session of the House of Delegates rather than the Annual Session, this report on the work of the Bureau of Health Education covers the period from Jan. 1 through Aug. 31, 1948.

One new position has been created in the Bureau in the hope of coordinating speaking trips by American Medical Association representatives from all departments, so that the Association would receive the greatest possible value from all traveling staff members. The original optimism about arranging numerous other speaking engagements in connection with trips already projected has not been found justified. For the most part, the schedules of traveling speakers from other departments are well filled, and it is seldom that it is possible to add any engagements to itineraries. However, 67 extra engagements which would not otherwise have been made have been arranged, accepted and filled.

QUESTIONS AND ANSWERS

Individual letters received and answered in the department concerned with medical inquiries from laymen totaled 6,551. The exact total of questions is considerably larger, since many letters contained as many as 4 or 5 questions. The total represents an appreciable increase over figures for the corresponding period in 1947, during which 5,788 replies were prepared. On a calendar year basis, the difference probably would be still greater, since the decided decrease in inquiries during the summer months weighs heavily in the present report.

The subject of medical practice stimulated the greatest number of individual questions, the total being 364. Breakdown of this showed 87 questions regarding the American Medical Association and its services, 71 queries about how to select a physician, 44 on medical history and 102 questions of a general nature. Replies to inquiries about selecting a physician included routine referral to the local medical society for more exact information.

Next on the list were inquiries regarding drugs, 311. The popularity of the newly developed antibiotics is reflected in the fact that there were 102 questions about penicillin and strepto-

mycin. Only 19 queries were received on the subject of sulfonamide drugs. There were 136 inquiries of a general nature.

Health education was third in the list, with 236 questions. Thirty-three of these related to health education in primary schools and 23 in high schools. There were 37 inquiries about how to become a medical student. Of the total, 108 questions were of a general nature.

Following in order were questions on eyes, 154, child care and training, 128, cancer, 117, and allergy and asthma, 105.

This department also replied to 128 inquiries referred from the Cleveland Health Museum, 129 from the Tennessee State Medical Association and 131 queries from various museum sources, such as the Dallas and Newark Health Museums.

BUREAU PUBLICATIONS

The Bureau reviewed 25 books for *THE JOURNAL* and 14 for *HYGEIA*, and prepared 19 other contributions to *THE JOURNAL*, such as editorials, radio announcements, articles and news items. It also prepared 70 contributions for *HYGEIA*, including manuscripts, questions and answers, items for "Mothers' Column," and "Teachers' Helps."

The Bureau originated 21 articles published in periodicals other than those of the American Medical Association, and furnished advice and consultation on manuscripts to 5 organizations.

Fifteen new pamphlets were added between Jan. 1 and Aug. 31, 1948, to the Bureau's list of publications, 6 were revised in text and 20 were discontinued. Distribution of Bureau publications through the order department during this same period was 229,254; 67,900 reprints were sold direct to quantity purchasers, making a total of 297,154.

The practice of evaluating a pamphlet when it is nearly out of stock, then either discontinuing it and replacing it with fresh material on the subject or revising and reordering it, is leading steadily to a completely up-to-date file. But since expense must be considered, the evolution must of necessity be a gradual process.

Perhaps the most gratifying surprise in this period was the success of the 1948 American Medical Association lay publications catalog, designed and processed this year, for the first time, by the Bureau of Health Education. Within the last seven months since its publication, over 28,000 copies have been distributed and, judging from the trend, at least 40,000 will have been sent out before the end of the year. This distribution is in contrast to that of the last catalog, published in 1946, which had a total distribution of 29,830 copies over a period of two years. The 1949 catalog is also being prepared and processed by this Bureau.

RADIO

The year 1948 marked a recession from the preceding year of exceptional activity.

Network Programs.—Although authorized for sale to suitable sponsors, the network programs remained unsponsored. The restrictions placed on sponsorship by Association policy are such that it is not easy to find a sponsor meeting the requirements who has sufficient financial resources to undertake a broadcasting venture of the magnitude involved in commercial network radio and whose business is sufficiently related to medicine to make an American Medical Association program a profitable venture. Efforts to sell the programs are continuing through the Marshall-Hester Productions, New York, and the Network Sales Division of the National Broadcasting Company, Chicago.

The 1948 NBC series was entitled "Doctors Today."

Great changes in approach and technic have been developing in radio, with a strong tendency toward the so-called documentary approach whereby the actual voices of persons who are doing certain work or having certain experiences are brought to the microphone, telling their story in their own words, often on tape recordings. Many such programs are on the air. All the networks except NBC now permit recorded voices for the documentary features of their programs. Every effort is being exerted to bring about a change in NBC policy, whereby the Association can use recordings on its broadcasts

over this network. Recordings are permitted on commercial news programs, but the same privilege is denied to broadcasters of educational programs. A number of conferences with radio critics at Columbus led to the conclusion that changes would have to be made in American Medical Association radio technics in order not to be left behind in the march of progress.

The Bureau of Health Education was the pioneer in popularizing the dramatization of radio health programs. Now the dramatic technic has been taken up in many quarters. The medical societies in Michigan, Wisconsin, Colorado, Jackson County, Mo., and others are making their own local transcriptions, many of which surpass in quality those made by the Bureau of Health Education.

On the other hand, an evaluation of the network program by the Schwerin Research Corporation through listening audiences is highly favorable. This report shows that 88 per cent of listeners responded favorably, 6 per cent unfavorably and 6 per cent indifferently. Few programs receive higher than 75 per cent favorable response, which makes the percentage of 88 very high, particularly in view of the basically educational character and purpose of the program. Curiously enough, the high point of interest was not in the dramatic episodes but at the times when physicians were giving straightforward information.

The format of the 1949 programs for which planning was begun in 1948 is being changed in order to keep pace with trends in the radio field.

Transcriptions: Seven electrical transcription series were made or remade during the year.

Transcription series now available are: three dramatizations, five musical programs and six interviews.

A special program using the Bureau's electrical transcriptions was carried out by the Tennessee State Medical Association.

Special Broadcasts: The special broadcasts included two sessions of the American Medical Association, the Interim Session at Cleveland in January and the Annual Session at Chicago in June.

A new technic was introduced in these broadcasts, and, instead of talks and interviews prepared in advance, a great deal of material was picked up in the Scientific Exhibit and at the meetings of the House of Delegates for use in network broadcasts and transcriptions. This was done with tape recorder.

Six radio programs were broadcast by staff members in local areas where they attended meetings.

TELEVISION

Through the continued helpful cooperation of television Station WBKB, the Bureau of Health Education presented 38 programs during the period from January 1 to August 31. That these presentations, introduced each week as "American Medical Association" programs, are reaching a considerable segment of the general population in Chicago and nearby sections is indicated by the fact that there are now 30,000 television receiving sets in the area. The station program, carried in Chicago newspapers, also lists the American Medical Association as a participant. Extreme care is exercised to present topics that will have adequate attraction for the general public; at the same time the material is kept on a high ethical level. On many occasions, representatives of various Councils or Bureaus at Association headquarters have cooperated in presentation of special features. Among these have been the Therapeutic Trials Committee of the Council on Pharmacy and Chemistry, the Council on Physical Medicine, the Council on Industrial Health, Bureau of Medical Economic Research, and Committee on Medical Motion Pictures.

Much helpful assistance has been provided by the Bureau of Exhibits in suggesting subjects for presentation and providing photographs, charts, equipment and models for demonstrations. Special programs presented during the period included an interview of Dr. Archer C. Sudan, first physician to receive the American Medical Association General Practitioner Award, an interview of Dr. Isaac Abt, on the occasion of his being awarded the Distinguished Service Medal of the Association, and five programs drawn from the scientific sections at the Chicago Session.

Helpful relationships have been established with numerous health agencies, including the Chicago Health Department, the Cook County Health Department, the local branch of the American Cancer Society, local offices of the National Tuberculosis Association and the public relations department of the Illinois State Medical Association. There is being developed a plan to present several programs dealing with projects sponsored by the Woman's Auxiliary of the Chicago Medical Society.

Although many technical details still remain to be mastered, it is apparent that television offers a valuable contact with the general public in the field of health education, and also is a means of promoting understanding of and sympathy with the aims of the American Medical Association.

"Newscasts" have been based on reports in *THE JOURNAL* or articles in *HYGEIA*.

There has been a steady, though not large, demand for the "Television Handbook," issued by the Bureau in 1947.

LOAN COLLECTIONS

Fifty-one loan collections of *HYGEIA* articles representing 24 different titles were sent out by the Bureau. Collections most in demand were those dealing with outstanding medical advances, cancer, heart disease and first aid. This selectivity followed closely the preferences of borrowers in the preceding year.

A greater total of physician requests than that for the entire year in 1947 was received, which gives added emphasis to the apparent fact that local civic organizations are turning more and more to physicians for discussions of health subjects before lay audiences.

HEALTH AND FITNESS

The two consultants in the Division of Health and Fitness accepted 79 invitations to address groups or take part in conferences or workshops in 23 states during the past eight months. Eight trips were made to consult with school or college authorities in regard to the development and expansion of health programs in such institutions.

The work of the consultants is being more and more concentrated in the field of school health service and school health education. The Conference on the Cooperation of the Physician in the School Health and Physical Education Program, October 1947, apparently stimulated considerable interest in the field of school health on the part of state medical associations and state health and education departments. As a consequence, school health problems were given consideration in a number of state medical association meetings this past year.

The publication of the report of the October 1947 Conference, "Physician and Schools," and the pamphlet "Health Appraisal of School Children," edited by the consultants, Dr. D. F. Smiley and Dr. Fred V. Hein, and published for the Joint Committee on Health Problems in Education, has met with an enthusiastic reception. These two brochures have been widely distributed in every state to physicians, school administrators, teachers and public health workers. Along with the pamphlet, "Suggested School Health Policies," these two publications make a fairly complete summary of principles for school health service which is apparently filling a very real need. Copies of each were also sent to the professors of preventive medicine in all the medical schools and to all the schools of public health.

The consultants have particularly worked with the states of Tennessee, Wisconsin, New Jersey, Arkansas and Illinois in improving their school health programs. Particular mention should be made of the Woman's Auxiliary of the Medical Society of New Jersey, which has furnished the leadership in organizing health councils in all the counties of the state and laying before those councils, the project of a four point school health program recommended by the State Department of Education and the State Department of Health.

The consultants have given assistance to the Joint Committee on Health Problems in Education in developing policies with regard to height-weight records for children, formulas for the allocation of tax moneys to schools, interscholastic boxing, administration of school health service programs, fluorescent lighting in schools and the use of germicidal lamps in schools.

Plans are being made for a second Conference on the Physician's Relationship to the School. It is planned that this conference will again be held at Highland Park, Ill., in the fall of 1949. It is expected that the meetings will be devoted to consideration of the private practitioner's relationship to the school health program, the part time school physician, the full time school physician and the part time public health physician in the school program.

The consultants are continuing to prepare a series of "Suggested Discussion Topics for Teacher Aids" to accompany each issue of *HYGEIA*. These materials continue to be widely utilized in connection with the use of *HYGEIA*, *The Health Magazine*, as a resource aid for health education in secondary schools. The consultants are called on to review a considerable number of films and other audiovisual aids for use in school health and physical education instruction.

The Association's Committee on Health and Physical Fitness, of which the consultants of this Division are members, held a meeting in conjunction with the annual session of the Association in Chicago.

The exhibit, "Examining the School Child," at the 1948 Annual Session of the Association attracted more attention among attending physicians than did the exhibit of the year before.

The Division lost the valued services of Dr. Jean F. Smiley on Sept. 1, 1948. Dr. Smiley has accepted an important post with the Association of American Medical Colleges.

MEETINGS AND CONFERENCES

The Bureau staff traveled 97,666 miles to attend meetings or addressed 130 audiences in 27 states. They participated in 71 conferences and committee meetings. It was necessary to decline 21 engagements because of previous commitments or travel difficulties.

COOPERATIVE RELATIONSHIPS

Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association.—The 1948 meeting of the Joint Committee was held March 22 to 24 in the offices of the National Education Association, Washington, D. C. The Committee reelected Dr. Bernice Moss, Chairman, Dr. George Lyon, Vice Chairman and Dr. D. F. Smiley, Secretary, for another one year term.

Among the principal items dealt with by the Committee were: adoption of a resolution recommending in substance that state and local governmental units allocate funds on a basis which will not penalize school districts for absence of children due to illness; adoption of a resolution recommending in substance that schools should not sponsor or conduct interscholastic boxing contests because of the extreme health hazards involved; adoption of a resolution stating in general that where there is mutual understanding and cooperation between departments of education and health, with the resultant pooling of the resources of both departments, good school health service programs have been developed under school administration, health department responsibility or through joint jurisdiction and that in the light of this experience there is no single pattern that can be recommended at the present time for all situations at either the state or local level; agreement that on the basis of present research the old standard of refraining from swimming for one hour after a heavy meal, particularly on the part of unskilled persons, should still be observed, and adoption of a resolution urging that licensed medical schools, research institutions, hospitals and laboratories be supported in their animal experimentation programs in view of the great progress which has resulted and is continuing to be made in the fight against disease through animal experimentation.

U. S. Children's Bureau Advisory Committee on Maternal and Child Health Service: The Director of the Bureau was reappointed to membership on the Advisory Committee together with Dr. James R. Miller, Trustee of the Association.

American Public Health Association Committee on Professional Education.—This is one of the most important committees on which the Director of the Bureau is a member, since it is working toward objectives fully endorsed by the

medical profession, namely, improvement of the public health by improving the qualifications and training of public health personnel. The committee meets about twice a year, including one meeting at the time of the A.P.H.A. annual convention. This committee has prepared reports on the qualifications of health officers, bureau chiefs, sanitarians and health educators and is working on other reports. It supervises the accreditation of schools of public health for giving the master's and doctor's degree in public health and directs the activities of the A.P.H.A. Merit System Unit and Placement Bureau. The Director has served two terms, the last of which expired early in 1948. Association policy ordinarily calls for retirement after two successive terms, but this policy was waived and the Director has been reappointed for a term expiring in 1950. A meeting was held in New York, March 22, 1948.

A. P. H. A. Sub-Committee on Accident Prevention.—This sub-committee is allocated to the Committee on Administrative Practice and is under the chairmanship of Dr. Donald Armstrong. The committee has furthered accident studies and considered publication of materials in the field of accident prevention.

A. P. H. A. Sub-Committee (Illinois) for Estimate of Needed Health Educators.—The Associate Director of the Bureau serves on this sub-committee on planning for health education.

A. P. H. A. Section on Health Education.—The Director was appointed to the Nominating Committee for this section.

American Cancer Society Educational Committee.—This committee meets every month, usually in New York, and usually starts its meeting at 4:30 p. m. and continues it into the evening. For this reason it becomes necessary to spend two full days in New York at times when the use of planes is impossible. The Director has therefore been unable to attend many of these meetings. This committee is concerned primarily with professional education and has shown very little interest in lay health education, except for money-raising campaigns for the Cancer Society.

The Director of the Bureau also serves on the following committees:

- Committee on Education and Public Information for the Home Safety Conference, National Safety Council
- Executive Committee, National Society for Medical Research
- National Committee for Traffic Safety
- Advisory Board on Health Services, American National Red Cross
- American Medical Association Committee to Confer with National Safety Council
- American Medical Association Advertising Committee
- The President's Highway Safety Conference, Committee on Organized Public Support
- Special Consultant in Health Education, American Medical Association
- Woman's Auxiliary
- Prentiss Award Committee
- Committee on Public Education, U. S. Office of Civil Defense
- Consultant in Radiological Defense, U. S. Office of Civil Defense

United States Government Agencies.—The Bureau continues to cooperate, largely by correspondence, with government agencies. Materials or information have been furnished during 1948 to numerous departments of the Federal Security Agency and to the Department of Agriculture, the Department of the Interior, the Department of State, the Army, the Navy, the Veterans' Administration, the Institute of Inter-American Affairs and the Office of the Secretary of Defense.

MISCELLANEOUS

The Bureau continued to compile information about attacks on and defense of medical research and to distribute it in response to requests.

The Bureau furnishes questions and answers to HYGEIA for publication and checks all galley and page proofs for medical accuracy.

The Bureau continues its cooperation with the Woman's Auxiliary.

As usual, the Bureau has enjoyed the cooperation of physicians outside the headquarters offices. Special thanks are due those who cooperated in radio, television and transcription programs and the consultants who have furnished answers to questions and have helped with advice and consultation. The Bureau appreciates the cooperation of other departments in the Association.

Bureau of Medical Economic Research

This report covers the activities of the Bureau of Medical Economic Research for the period from Jan. 1, 1948 to Oct. 1, 1948. During these nine months the Bureau has published five items:

"The Selling Price of a Medical Practice," which appeared in THE JOURNAL Jan. 31, 1948, was prepared because of numerous inquiries about the procedure to be followed when a retiring physician wished to dispose of his practice. The executive secretaries of a number of state medical associations gave valuable suggestions.

"Comparative Increases in the Cost of Medical Care and the Cost of Living" was hurriedly prepared for the use of the American Medical Association representatives attending the National Health Assembly in Washington on May 4, 1948.

"An Annotated Bibliography on Group Practice, 1927-1947" is a summary of the literature on group practice and has been very well received. This bulletin is the first published item in the Bureau's continuing study of group practice.

"What is the Leading Cause of Death?" was published in THE JOURNAL for Oct. 16, 1948. This is a statistical and actuarial study which shows that accidental deaths cut off more years from the working lifetimes of the American people in 1945 than any one natural cause of death. This bulletin is an eloquent testimonial, albeit statistical, of both specific medical progress (control of pneumonia and tuberculosis) and general medical progress (sharply lower mortality among young persons).

It is believed that this study will reorient public thinking on the nation's health problems.

"How Rich Are You?" is a small pamphlet in which an indirect method is employed to refute the notion that the citizen "can get something for nothing." This widely held notion is the root cause of much of the support for socialized medicine. This bulletin is of interest to physicians' wives or to anyone who keeps household accounts for a family.

"The Cost and Quantity of Medical Care in the United States" is the most exhaustive study the Bureau has published since it was reorganized in the fall of 1946. It covers three aspects of medical economics—cost, price and quantity of medical care. On the cost side, attention is called to the increase in the dollars which the American people spend for medical care and the fact that these dollars are a decreasing percentage of total consumer expenditures for all goods and services. It is particularly noteworthy that the percentage of total consumer expenditures for physicians' services has been declining more rapidly than have the percentages for the other items in medical care. In fact, the physician in 1929 received 32 cents out of the average dollar spent by the consumer for medical care; in 1935-1939 the physician's share had dropped to 31 cents, and in 1947 it was slightly more than 25 cents. Thus it is clear that the physician's share is on the decline. On the other hand, the hospital share has risen from 13 cents in 1929 to 21 cents in 1947. The second aspect covered is prices (or fees). In the last ten years unit prices of goods and services purchased by consumers—the cost of living—have risen 59 per cent, whereas unit prices—fees, hospital room rates—in the medical care field have risen only 32 per cent. Again we say that medical care prices have behaved much better from the point of view of the consumer than have prices generally. The third aspect covered in this bulletin is quantity of medical care. This is practically the first treatment of the subject of quantity of medical care in the literature of medical economics. Although the data have severe limitations, the conclusion is that the quantity of medical care received by the American people has been increasing rapidly in the past decade and far more rapidly than the number of physicians. This conclusion is particularly important in the light of various claims that there is a great shortage of physicians in the United States.

The steady demand for the bulletins published in 1947 and 1948 has required the Bureau to reprint some of them. The Bureau has made available to the state medical associations for public relations purposes slides of the charts used in the article, "Is Medical Care Expensive?" and has offered to do the same with respect to "The Cost and Quantity of Medical Care in the United States." The last paragraph of this bulletin includes the following statement: "The quest for better health, improved

medical care and longer life is a never-ending quest. It will continue as long as pain comes too often and death too soon. Members of the medical care team have an unlimited opportunity to improve medical care and at the same time are exposed to the hazard of attaining one goal only to find that the goal has been moved up. The demand for improved medical care is well-nigh insatiable, and those who try to provide it are subject to easy criticism."

The response to the bulletin on "The Cost and Quantity of Medical Care" and its companion bulletins has convinced the Director of the Bureau that some of the attacks on the American medical profession are due to lack of understanding of the unique function of the physician in our society. Medical care can and will improve but it can never be adequate. The number of deaths is not as important as the average number of years the decedents had lived.

In addition to these Bureau bulletins, more than a score of major articles and book reviews have been published in *THE JOURNAL*. This increase in the number of items published measures the growing maturity of the research staff of the Bureau. Some of the longer reviews of important books have been mimeographed and sent to the members of the House of Delegates. The Director has read several manuscripts dealing with statistical data and methodology for the Editorial Department.

IBM

The IBM section of the Bureau of Medical Economic Research has performed work [at cost] for a number of agencies. It has assisted the Council on Medical Education and Hospitals in making a considerable number of the tabulations for the hospital and licensure numbers of *THE JOURNAL*. An analysis of differences in clauses in policy forms was made at cost for Associated Medical Care Plans. Special tabulations of all the physicians in the state of Illinois were made at cost for the Illinois Department of Health. The addresses of approximately 9,000 physicians in the age group 19-25 were listed for the Office of Selective Service Records. Analyses of two questionnaires on advertising matters were made for the Advertising Department.

The principal IBM operation during the past nine months has been the development of the three card file. There will be three basic cards for each of the 220,000 physicians in the United States, Canada and the United States possessions. In a few weeks the Directory Department will provide galley proofs of the new American Medical Directory, and additional information from these galley proofs will be punched into the cards. The Bureau punch card file will ultimately contain a considerable number of categories of information which will not be published in the Directory. It is hoped that the three card file can be completed by the middle of 1949. IBM operations consume more than one half of the budget of the Bureau.

Two major research projects are still in progress. Reference has already been made in this report to the bibliography on group practice, the first step in the special study of group practice. The establishment of medical service areas has proceeded at a steady pace. They are almost completed in every state. The study probably will be published during the summer of 1949, and when completed will show that everyone in the United States has access to physicians and that each square mile in the United States is located in a medical service area in which there are physicians. This is a joint project with the constituent state medical associations. Some of the state associations have already found their medical service areas useful tools in the field of public relations.

REFERRALS FROM HOUSE OF DELEGATES

The Bureau has noted the recommendation contained in the report of the Committee to Study Conditions of General Practice and Committee on Nursing Problems, which were presented to the House of Delegates at the 1948 annual session. Through its punch card system, the Bureau has accumulated a considerable amount of data on the distribution of physicians. In the Aug. 21, 1948 issue of *THE JOURNAL* the Bureau presented a tabulation of the number of physicians by states; it was noted that the number of physicians had increased 17 per cent, whereas the population had increased only 12 per cent. As the work of

keeping the punch card file progresses the Bureau will offer special tabulations for publication in *THE JOURNAL*. The next will be an age distribution of physicians by states and an estimate of the number of people per physician in each state.

The Reference Committee on Legislation and Public Relations directed the Bureau to study the matter of life insurance fees pursuant to a resolution introduced by a delegate from New Jersey. At the present writing the Bureau is awaiting the compilation of replies to a comprehensive questionnaire survey on medical fees by the life insurance companies. An analysis of this questionnaire will be prepared and made available to the members of the House of Delegates at the December meeting if the survey is completed by November 15.

Bureau of Exhibits

The Bureau of Exhibits has continued to function with greatly increased activities.

The work of the Bureau includes several divisions. The Scientific Exhibit is presented at the Annual and Interim Sessions of the Association under the Committee on Scientific Exhibit of the Board of Trustees. Medical exhibits are prepared with the advice of the various councils and bureaus of the Association and are shown at numerous medical meetings and other scientific organizations. Health exhibits are prepared for use at fairs, expositions and other public gatherings. The subject of medical motion pictures, in which field the Association has assumed leadership, is administered under the guidance of the Committee on Medical Motion Pictures. Other miscellaneous activities connected with graduate medical instruction and health education are also directed to the Bureau.

The staff of the Bureau has remained small, with each division of the work under the management of persons selected for their experience and adaptability in their particular fields.

THE SCIENTIFIC EXHIBIT

The year 1948 is marked by three sessions of the American Medical Association, for each of which a Scientific Exhibit has been prepared. The report of the work of the Bureau in connection with the Interim Session in Cleveland was included in the report to the House of Delegates in June. The program for the Interim Session in St. Louis is in the process of completion.

The Scientific Exhibit at the Chicago Session was an outstanding success. The care with which the exhibitors selected their material, the artistic ability with which they displayed it, the patience and perseverance of the demonstrators through the long days of the week all resulted in crowded aisles. The studious attitude of the physicians present attested to the value of this form of graduate medical instruction.

The Special Exhibit on Fractures was more popular than ever, even though the subject has been shown more or less continuously for twenty years. Dr. Kellogg Speed, Chicago, assisted by a competent committee and a large corps of demonstrators, deserves much credit for this type of presentation.

The Special Exhibit on Physical Medicine, shown for the third time with Dr. Frank H. Krusen, Rochester, Minn., as chairman, not only had a spectacular appeal, but included the practical information necessary for the physician in general practice. The constant throng surrounding the eight booths in the exhibit was an indication of the desire on the part of physicians for more knowledge on the subject.

The Special Exhibit on Fresh Pathologic Material, under the direction of Dr. I. Davidsohn, Chicago, proved a valuable part of the meeting. The cooperation of various hospitals and the continuous demonstrations by competent pathologists attracted a constant attendance of intent observers.

The group of exhibits on diabetes was supplemented by clinical presentations in an adjoining room. Dr. Howard F. Root, Boston, arranged a most attractive program which was one of the most popular features of the meeting.

Cancer detection was emphasized by a group of eleven exhibits presented with the cooperation of the American Cancer Society, the American College of Surgeons and the Cancer Prevention Center of Chicago. The chairman was Dr. Augusta Webster, Chicago.

The medical aspects of atomic energy were featured by a group of ten exhibits which attracted an unusual amount of attention. The Atomic Energy Commission, the Army, Navy and Air Force, as well as individual investigators, participated.

The seventeen sections of the Scientific Assembly presented outstanding groups of exhibits dealing with the various branches of medicine. The exhibits were selected for their suitability for the physician in general practice from 294 applications for space, 169 being selected for the sections and 31 placed in a miscellaneous group. The various sections appointed representatives to advise and assist the Committee on Scientific Exhibit, and each application was submitted to five or more persons separately, from whom it received unanimous approval before acceptance. The largest number of exhibits was presented by the Section on Surgery, General and Abdominal, with 26, while the smallest number was in the Section on Anesthesiology, with 4.

There were 26 awards, consisting of 6 medals, 10 certificates of merit and 10 honorable mentions. In addition, three groups of exhibits received special commendation. The Committee on Awards consisted of Dr. Frank W. Hartman, Detroit, chairman; Dr. Wilbur Bailey, Los Angeles; Dr. David Bosworth, New York; Dr. Deryl Hart, Durham, N. C., and Dr. Joe Vincent Meigs, Boston.

The Committee on Scientific Exhibit worked closely with the Council on Scientific Assembly on the program. Twenty-seven papers read before the Sections were correlated with exhibits.

Motion pictures were shown in two theaters, simultaneously and continuously, in an area adjoining the exhibits. Thirty-seven films were selected from 74 applications, most of the films being previewed by competent consultants before acceptance or rejection. The audiences were large and enthusiastic, a count of the attendance totaling 14,280 persons (this includes duplications of those who stayed to see more than one film). Several of the films illustrated exhibits on the same subject.

ASSOCIATION EXHIBITS

Professional relations with many thousands of physicians, as well as public relations with hundreds of thousands of other persons, were enhanced through exhibits depicting the activities of the various councils and bureaus of the American Medical Association headquarters. The opportunities for this kind of activity are numerous, the audience attend in a receptive mood and the graphic presentations make a lasting visual impression.

The Bureau has on hand forty-eight exhibits, nine old exhibits being discontinued and eight new ones added during the year. Each exhibit is checked and repaired after each trip. At present, working and storage facilities are inadequate for this activity, but it is hoped that with the completion of the addition to the Association's building more space will be available.

One hundred and thirty exhibits were shown, or had been reserved at the time of this report, for 82 meetings during the year, and additional requests are still being received. The demand greatly exceeds the number of exhibits available, especially at certain seasons. There were 38 medical meetings or other professional gatherings, including those of dentists, pharmacists, nurses and various scientific groups, at which 61 exhibits were shown. An attendant from the headquarters staff was present at each of these meetings to demonstrate the exhibit. Sixty-nine exhibits were shown at 44 fairs and expositions, the material being sent out on a loan basis, with a member of the local county or state medical society in charge.

The duration of each exhibit averaged one week, making nearly one thousand days for this group of displays during the year. The exhibits were shown in thirty states and the District of Columbia. Requests from outside the limits of Continental United States were refused because of the cost and difficulties with custom regulations.

MUSEUMS

The several health museums in the country, which are visited by some millions of persons, have had exhibits from the American Medical Association on permanent display. The Cleveland Health Museum, the Toledo Museum of Science, the Dallas Health Museum, and the Chicago Museum of Science and Industry are especially to be commended in this regard. Temporary displays have gone to other museums as well.

The museum is an excellent medium for health education, with a ready made audience which attends in a receptive attitude.

COMMITTEE ON MEDICAL MOTION PICTURES

There has been a considerable increase in all phases of activity over last year. As the Association's motion picture program becomes more widely known, a greater number of medical societies, medical schools, hospitals and individual physicians are calling for various types of service.

Library of Medical Films.—A total of 1,091 films were lent to various organizations and physicians during the first eight months of 1948 in 45 states, as well as to Mexico and Bolivia. In order to help meet the increasing cost of operating the motion picture library, the Committee voted to make a service charge of \$1 per reel (400 feet) for the use of the films, but to date details for handling the problem have not been worked out.

Inasmuch as there are a great many sources of health films, the Committee decided that the American Medical Association should not distribute such films to lay groups. A select group of health films are available, however, to Fellows of the American Medical Association who are called on to speak before service clubs, Parent-Teacher Associations and other public groups. Thirty-three prints of twelve new films were added to the motion picture library during the first eight months of the year.

Reviews of Motion Pictures.—Because of printing difficulties, the number of motion picture reviews published in *THE JOURNAL* was somewhat curtailed; nevertheless, forty-one reviews were published during the eight month period. These reviews are widely read by the medical profession in the United States and foreign countries. A pamphlet has been prepared, containing reprints of the medical motion picture reviews published in *THE JOURNAL* through January 1948. The purpose of these reviews is to provide a brief description and evaluation of motion pictures which are available to the medical profession.

Source List.—The source list of medical films has been revised and brought up to date. Eighty-eight lists also have been prepared on specific subjects, such as pathology, immunology and hematology, containing titles of films on these subjects, where they may be obtained and other information.

The organization of a complete source file of available medical films is progressing slowly.

Special Projects.—The Sears-Roebuck Foundation is sponsoring the production of a motion picture dealing with rural health problems. Assistance has been given the project with background material and advice in the preparation of the script.

The Becton, Dickinson Foundation for the Advancement of Scientific Knowledge is sponsoring a film dealing with "The Physician's Responsibility in the Event of Major Disaster" and a committee of technical advisers has been appointed, consisting of Col. W. L. Wilson, M.C., United States Army, Washington, chairman; Dr. Frank Wilson, American Red Cross, Washington; Dr. Norvin C. Keifer, Chief, Health Emergency Planning Unit, U. S. Public Health Service, Washington; Dr. James C. Sargent, Chairman, Council on National Emergency Medical Service; American Medical Association; Dr. Perrin Long, Technical Medical Adviser to the Director of O.C.D. Planning, Baltimore, and the Secretary of the American Medical Association Committee on Medical Motion Pictures. The film should be in production early in 1949.

In connection with the 1948 Census of Hospitals and Report of Internships and Residencies, four questions concerning motion picture equipment and the use of medical motion pictures have been included in the questionnaire. The results of this preliminary survey should be available to the Committee in February 1949.

During the past eighteen months, the American Medical Association has received approximately seventy-five requests from thirty-three different countries for the loan or purchase of American made medical films. These unsolicited requests have come from medical schools, hospitals and individual physicians.

A survey has been made to determine the number of states which maintain film libraries in connection with the state health

departments. It was found that all of the states have film libraries, but most of them confine distribution to their own states and several restrict distribution to county health departments.

MISCELLANEOUS ACTIVITIES

Numerous talks have been given by members of the staff to scientific groups and luncheon clubs. Conferences with physicians and other persons, both from the United States and foreign countries, have been of almost daily occurrence. Members of the staff have served on many committees of organizations allied to the American Medical Association and have given freely of their knowledge and energy. Pamphlets and articles have been prepared for publication and books reviewed for *THE JOURNAL*.

The preeminent place of leadership which the Association has attained in both the exhibit field and in motion pictures has brought numerous requests for information and advice, all of which have been given careful attention.

Conclusion

Reports of committees, such as the Committee on Hospitals and the Practice of Medicine, the Committee on Nursing Problems which now represents the Association on the Joint Commission for the Improvement of Medical Care, the Committee on Rebates and the Committee on Rural Medical Care will be presented in the Handbook of the House of Delegates or in a Supplementary Report of the Board of Trustees to the House.

Respectfully submitted,

REPORT OF COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

To the Members of the House of Delegates of the American Medical Association:

The major concerns of the Council on Medical Education and Hospitals during the six months since it last reported to the House of Delegates have been with the financial support of medical schools, the actions taken by the House of Delegates at the June 1948 Session which were referred to the Council, the Selective Service Act of 1948, and the development of a plan for meeting effectively the Council's increasing responsibilities for the approval of internship and residency training programs.

FINANCIAL SUPPORT OF MEDICAL SCHOOLS

During the last three years the Council has been directing attention to the fact that the major problem currently facing the medical schools of the United States is the need for additional funds for the development and stabilization of their basic educational programs. Inflation, decreased income from endowments and changes in the tax structure which have led to a decrease in the size of individual benefactions, have created a serious problem for the medical schools. This problem affects the schools both with respect to maintaining established programs and with respect to undertaking essential new developments.

In the past year there have been numerous discussions pointing to the possibility that to solve their financial problems the medical schools may have to accept federal subsidy. A bill, S. 2588, to provide such subsidy was introduced into Congress in April 1948 by Senator Thomas of Utah. No hearings were held on the bill, but it may be predicted that bills of a similar nature will be introduced into the next Congress.

The Council has given close study to the financial needs of the medical schools and to the issues involved in federal subsidy of the medical schools. As a result of this study, the Council is strongly of the opinion that before resort is made to federal subsidy an intensive and concerted effort should be made to secure the funds required by the medical schools from voluntary sources. The Council is further of the opinion that there is good reason for believing that, if such an effort is made, support can be obtained in adequate measure.

In June of this year the Council sought and obtained authorization from the Board of Trustees to explore with representatives of the Association of American Medical Colleges and other interested organizations the possibility of establishing a National Foundation for Medical Education which would have as its objective the securing of funds from voluntary sources for the basic support of the medical schools of this country. In July of this year, under the joint sponsorship of the Council and the Association of American Medical Colleges, a meeting was held in New York City of representatives of universities, business, industry, banking, educational foundations and voluntary philanthropic organizations in the health field, to discuss the feasibility of a national campaign for the support of medical education.

After presentation and discussion of the problem, the consensus was that such a campaign was highly desirable and offered definite promise of success. A lay committee was appointed under the chairmanship of Mr. Earl Bunting, Managing Director of the National Association of Manufacturers, to study the problem further and report back to the Council and the Association of American Medical Colleges. During August and September this committee and a subcommittee under the chairmanship of Mr. Earl O. Shreve, President of the United States Chamber of Commerce, held three meetings in New York City. Additional meetings will be held throughout the fall, with the expectation that a definite plan of organization for a National Foundation for Medical Education will be ready for presentation to the Council and the Association of American Medical Colleges by the end of 1948 or the early part of 1949.

It has been a source of great encouragement to observe the deep interest which the leaders of commerce and industry have shown in the problems of the medical schools and the time and energy that they are devoting in seeking a solution. It is too early to judge the final outcome, but it can be said that the outlook for adequate support of the medical schools from voluntary sources is brighter at the present than at any time in recent years.

REPORT ON MATTERS REFERRED TO THE COUNCIL BY THE HOUSE OF DELEGATES

At its June 1948 meeting the House of Delegates referred a number of resolutions to the Council. A summary of the Council's action on these resolutions follows:

Recommendations contained in the Report of the Committee on Intern Placement are:

The amendments to the 1948 Plan for Uniform Intern Placement suggested by the Committee in collaboration with the Joint Intern Committee were approved by the Council and the other organizations sponsoring this plan. The amended plan was published in *THE JOURNAL* Aug. 14, 1948.

The Council is in full accord with the recommendation that hospitals and medical schools which do not cooperate with the plan be reported to the Council for investigation and appropriate action. This recommendation is now being studied by the other agencies sponsoring the Plan for Uniform Placement.

The recommendation that all specialty boards require at least one year of approved rotating internship before allowing a physician to start his specialty training has been forwarded to the Advisory Board for Medical Specialties and will be discussed at the next meeting of the Liaison Committee of the Council and the Advisory Board.

Recommendations concerning the scope, character and duration of an approved rotating internship are being incorporated by the Council in an extensive revision of its "Essentials of An Approved Internship," which the Council now has under preparation. As soon as the revision is completed, the revised "Essentials" will be presented to the House of Delegates for ratification.

The recommendation that specialty boards should be requested to give credit toward certification for work in their respective fields during the second year of a rotating internship has been forwarded to the Advisory Board for Medical Specialties and will be discussed at the next meeting of the Liaison Committee of the Council and the Advisory Board.

With respect to the recommendation that hospitals at present approved for internship should be reappraised on the basis of their educational program for interns, the Council is continuously resurveying and reappraising approved hospitals within the capacity of its staff. A general reappraisal will be initiated after the revised "Essentials of An Approved Internship" have been adopted by the Council and ratified by the House of Delegates.

The recommendation that any hospital which does not provide an adequate educational program for interns may be approved for general residencies has been interpreted by the Council as meaning that hospitals which meet its "Essentials for a General Residency" may be approved even though they may not provide an educational training program for interns. The Council now lists 90 hospitals that are approved for general residencies but not for internships and will add other hospitals to this list as they demonstrate their ability to offer a satisfactory training program.

Resolution that the American Medical Association institute a program to allocate the number of interns of all approved hospitals on an equal basis according to yearly admissions and that this be referred to the Council on Medical Education and Hospitals for consideration. The Council is being guided by this resolution in revising its "Essentials of An Approved Internship."

Recommendations contained in the Report of the Committee to Study Conditions of General Practice are:

That the Council on Medical Education and Hospitals and the Bureau of Medical Economic Research determine whether or not there is need for a large increase in the number of medical graduates and, if so, its extent.

The Council and the Bureau have collaborated in studying this problem. Information provided by the study has served as the basis for an editorial in THE JOURNAL, a report to the National Health Assembly, for talks and discussions by officers of the Association and for replies to numerous inquiries from government agencies, medical societies, universities, the press and individuals. These studies have led to the conclusion that there is no need for any great increase in the number of medical graduates and that the gradual expansion of facilities for medical education that is taking place will adequately meet the nation's needs. The Council will continue to give close attention to this problem.

That the Council on Medical Education and Hospitals proceed with the development of a program for the training of general practitioners in smaller community hospitals.

The Council is formulating standards for residencies in general practice. When these standards have been developed, smaller community hospitals that are willing and prepared to give proper supervision to the training of residents in general practice will receive every encouragement from the Council.

Resolution that the Council investigate the Association of Interns and Medical Students and the Association of International Medical Students as to facts, tendencies, affiliations and objectives.

The Council has this resolution under study but is not yet prepared to report on it.

DEFERMENT OF PREMEDICAL AND MEDICAL STUDENTS UNDER THE SELECTIVE SERVICE ACT OF 1948

The Selective Service Act of 1948 renders liable for service in the armed forces men between 19 and 25 years of age, the age group from which the great majority of premedical and medical students are drawn. Immediately on passage of the act, representatives of the Council and the Association of American Medical Colleges began a series of conferences with officials of the National Headquarters of the Selective Service System to develop a plan for the deferment of all medical students and a sufficient number of premedical students to insure that there would be no reduction in the years ahead of the number of students and graduates. The officials of the Selective Service System have shown a good understanding of the problem and have been very cooperative in approaching the question of deferments. They have made it clear that bona fide medical students and physicians in their first year of internship will be deferred as long as they maintain a satisfactory academic standing. While no announcement has yet been issued concerning the deferment of premedical students, there is every reason to believe that a plan which has the endorsement of the Council and the Association of American Medical Colleges will be officially adopted by the National Headquarters of the Selective Service System at an early date.

PART TIME HOSPITAL INSPECTORS

The reduction in the professional staff of the Council during and immediately after the war and the rapid postwar expansion of residency training programs created serious difficulties for the Council in carrying out its inspection of hospitals holding or seeking approval for internships and residency training.

Even with its staff again at full strength, it became clear to the Council that the backlog of hospitals requiring inspection that had accumulated during the last five years could not be satisfactorily inspected unless a plan was devised for securing the assistance of additional personnel. Accordingly, the Council has requested and obtained from the Board of Trustees permission to enlist the services as part time inspectors of fifteen qualified physicians in different areas of the country. It is planned that each of these inspectors will survey about 40 hospitals during the coming year for a total of 600 hospitals. During the same period, the full time staff of the Council will survey approximately the same number of institutions, so that by the end of 1949 the Council will be operating on a current basis with respect to the inspection of hospitals.

The Council has shared the increasing concern of the House of Delegates, the American Boards and other groups interested in graduate education with respect to the need for a periodic reappraisal of hospitals holding approval for internship and residency training. The Council is confident that once it is operating on a current basis, it should be able to institute a program of triennial reinspection of all approved hospitals and more frequent reinspection of those requiring special attention. Such a program is essential for the maintenance of high standards of graduate training in the hospitals throughout the country.

COLLABORATION AND LIAISON WITH OTHER AGENCIES

The Council has continued to maintain a close liaison with other agencies and organizations active in the field of medical education and hospital affairs. The close relations that the Council enjoys through regularly constituted liaison committees with the Association of American Medical Colleges and the Advisory Board for Medical Specialties have been particularly beneficial. The Council has continued its cooperation with the Army, Navy, the U. S. Public Health Service and the Veterans Administration in the development of their programs for graduate medical training. Collaboration with numerous other agencies in the field of health, medicine and education has continued. These conjoint activities have been varied in nature and have involved members of the Council, the Secretary and the members of the staff of the Council. These cooperative enterprises have included consultations, participation in conferences, meetings, the work of advisory committees and joint sessions. A partial list of the agencies and organizations not mentioned elsewhere in this report with which the Council has collaborated during 1948 includes:

- The American Hospital Association
- The Catholic Hospital Association
- The American Trudeau Society
- American Orthopedic Association
- American Academy of Orthopedic Surgeons
- Southern Medical Association
- National Society for Medical Research
- National Health Assembly
- American College of Surgeons
- Federation of State Medical Boards
- United States Office of Education
- State Department
- Florida State Board of Education
- National Nursing Council
- American Nurses Association
- National Board of Medical Examiners
- American Physiotherapy Association
- American Registry of Physical Therapy Technicians
- American Occupational Therapy Association
- American Association of Medical Record Librarians
- College of American Pathologists
- American College of Radiology
- American Registry of X-ray Technicians
- Board of Registry of Medical Technologists
- State Medical Societies
- County Medical Societies

MEDICAL SCHOOLS

During the first nine months of 1948 the following medical schools were visited for consultation, survey or other purposes:

- Hahnemann Medical College and Hospital of Philadelphia
- Medical College of the State of South Carolina
- University of Oklahoma School of Medicine
- Howard University College of Medicine
- Loyola University School of Medicine
- University of Buffalo School of Medicine

INSPECTION OF HOSPITALS AND TECHNICAL SCHOOLS

Inspections of hospitals and technical schools made by the Council during the first nine months of 1948 may be summarized as follows:

Intern training	26
Residencies and fellowships	136
Intern training and residencies	42
Registration	18
Technical schools	40
Total	262
Individual residencies and fellowships investigated	668

SUMMARY OF HOSPITALS AND TECHNICAL SCHOOLS

Figures for approved hospitals and technical schools with changes occurring during the first nine months of 1948 are as follows:

Registration of Hospitals	
Hospitals registered, Jan. 1, 1948	6,312
New institutions registered to Sept. 30, 1948	125
Closed or transferred to unclassified file	180
Hospitals registered, Sept. 30, 1948	6,257
Internship Approval	
Hospitals approved for intern training, Jan. 1, 1948	812
Approved to Sept. 30, 1948	28
Removed from approved list	6
Hospitals approved for intern training, Sept. 30, 1948	834
Residency Approval	
Hospitals approved for residency training, Jan. 1, 1948	1,086
Approved to Sept. 30, 1948	65
Removed from approved list	20
Hospitals approved for residency training, Sept. 30, 1948	1,131
Medical Technology Schools	
Approved schools, Jan. 1, 1948	308
Approved to Sept. 30, 1948	29
Removed from approved list	0
Approved schools, Sept. 30, 1948	337
Medical Record Librarian Schools	
Approved schools, Jan. 1, 1948	11
Approved to Sept. 30, 1948	1
Removed from approved list	0
Approved schools, Sept. 30, 1948	12
Occupational Therapy Schools	
Approved schools, Jan. 1, 1948	22
Approved to Sept. 30, 1948	3
Removed from approved list	0
Approved schools, Sept. 30, 1948	25
Physical Therapy Schools	
Approved schools, Jan. 1, 1948	26
Approved to Sept. 30, 1948	0
Removed from approved list	1
Approved schools, Sept. 30, 1948	25
X-Ray Schools	
Approved schools, Jan. 1, 1948	183
Approved to Sept. 30, 1948	29
Removed from approved list	1
Approved schools, Sept. 30, 1948	211

COUNCIL PUBLICATIONS

During 1948 the Council was responsible for preparing material for four special numbers of THE JOURNAL:

Internship and Residency Number
State Board Number
Hospital Number
Educational Number

Other regular publications of the Council during the year included:

Postgraduate Courses for Veteran and Civilian Physicians
Approved Examining Boards in Medical Specialties (a Summary of the Requirements for Certification Established by the American Boards)
Proceedings of the 1948 Annual Congress on Medical Education and Licensure (now in press)
Choice of a Medical School
Approved Colleges of Arts and Sciences
Federation Bulletin (a monthly bulletin published for the Federation of State Medical Boards)
Approved Internships
Approved Residencies and Fellowships in the Specialties
Schools for Medical Technologists
Schools for Physical Therapy Technicians
Schools for Occupational Therapy
Schools for Medical Record Librarians
Schools for X-ray Technicians

The Council also has reprinted for distribution a number of articles dealing with questions relating to the Council's work

and responsibilities. In addition, the Council has published numerous statements in THE JOURNAL from time to time concerning current problems.

ELECTION OF DR. WILLIAM LOWRY PRESSLY TO
THE COUNCIL

Dr. William Lowry Pressly of Due West, S. C., was elected by the House of Delegates to fill the vacancy on the Council created by the death of Dr. John H. Musser.

PROFESSIONAL STAFF CHANGES

Dr. Edward H. Leveroos has been made an Associate Secretary of the Council by the Board of Trustees. Dr. Leveroos heads the internship and residency section of the Council's professional staff.

Dr. William W. Southard of Los Angeles and Dr. Robert C. Parkin of New Albin, Iowa, have been appointed to the professional staff. Dr. Edward K. Reid has resigned from the staff to accept a commission in the U. S. Public Health Service.

APPRECIATION

To carry out much of its program the Council on Medical Education and Hospitals must rely on the cooperation of numerous institutions and organizations. In every instance this cooperation has been given willingly and fully. The Council wishes at this time to record its sincere gratitude for the assistance so received. The Council is particularly grateful for the splendid support and cooperation that it has continued to receive from the officers, trustees and members of the House of Delegates of the American Medical Association. Their understanding and willingness to aid in the solution of the many difficult problems that have confronted the Council during the past year have been a continuing source of encouragement and gratification.

Respectfully submitted.

HERMAN G. WEISKOTTEN, Chairman
REGINALD FITZ
RUSSELL L. HADEN
WILLIAM S. MIDDLETON
VICTOR JOHNSON
HARVEY B. STONE
WILLIAM L. PRESSLY
DONALD G. ANDERSON, Secretary.

REPORT OF THE COUNCIL ON
SCIENTIFIC ASSEMBLY

The Council on Scientific Assembly has met three times since the 1948 Annual Session in Chicago, once on July 24 in Chicago and once on September 28 in St. Louis and again on November 13 in Chicago.

The Council offers the Scientific Program for the St. Louis Interim Session as part of its report.

SECTION ON DISEASES OF THE CHEST

The following officers were appointed to serve at the first meeting of the Section on Diseases of the Chest, to be held at the 1949 Annual Session in Atlantic City: Dr. Shelley U. Marietta, Washington, D. C., Chairman; Dr. Harry C. Warren, San Francisco, Vice Chairman, and Dr. Jay Arthur Myers, Minneapolis, Secretary.

After full discussion, the Council ruled that, in accordance with the provisions of the Constitution and By-Laws, a delegate and an alternate delegate to the House of Delegates for the new Section on Diseases of the Chest should be elected by the Section at its first Section meeting.

SECTION ON MISCELLANEOUS TOPICS

The Council allotted two sessions in the Section on Miscellaneous Topics at the 1949 Annual Session in Atlantic City to Physical Medicine and appointed Dr. Howard A. Rusk, New York, to serve as Chairman, and Dr. Frank H. Krusen, Rochester, Minn., as Secretary.

The Council allotted one session in the Section on Miscellaneous Topics at the Atlantic City Session to Allergy and appointed the following officers: Dr. Charles H. Eyerma, St. Louis, Chairman, and Dr. Harry L. Huber, Chicago, Secretary.

The Council considered the desirability of having a session on the History of Medicine at each Annual Session of the American Medical Association. Having in view the relatively small attendance at these meetings in the past, it was the opinion of the Council that historical medicine should be encouraged, nevertheless, and meetings held every second or third year.

ALLOCATION OF SECTION MEETINGS AT THE ANNUAL SESSION

The revised By-Laws adopted at the 1948 Annual Session in Chicago grant to the Council on Scientific Assembly the power of determining the number of sessions, up to a maximum of three, for each section at each annual session. The Council has long been active in surveying the attendance at various section meetings at the annual sessions and, during the last five years at four annual sessions, a count has been made of the approximate attendance at each session of a section meeting, except when two sections combined for one meeting. The figures presented to the Council are contained in the following chart.

Approximate Attendance A. M. A. Section Meetings 1944—1946—1947—1948

On the basis of the figures as reported and taking into consideration the space available in appropriate localities in Atlantic City for meetings of the Sections, the Council allotted, for the 1949 session only, the following schedule of section meetings.

Section	Units
Internal Medicine	3
Surgery, General and Abdominal.....	3
Obstetrics	3
Pediatrics	3
General Practice	3
Ophthalmology	2
Laryngology, Otology and Rhinology.....	2
Experimental Medicine and Therapeutics.....	2
Pathology and Physiology.....	2
Nervous and Mental Diseases.....	2
Dermatology and Syphilology.....	2
Urology	2
Orthopedic Surgery	2
Gastro-Enterology and Proctology.....	2
Radiology	2
Anesthesiology	2
Diseases of the Chest.....	2
Preventive and Industrial Medicine and Public Health.....	2

In general the council followed the principle that the five sections with the largest attendance should be allotted three units at each annual session, a unit consisting of a half-day session.

Twelve other sections were allotted two units each, and one, the Section on Preventive and Industrial Medicine and Public Health, a section with attendance reported to be usually less than one hundred at any one session, was allotted only one unit. On further consideration, the Council felt that, although the attendance at meetings of this section, as recorded, was small, the importance of public health and industrial medicine was such that two units should be allocated to this section. Thus the original ruling to allocate only one unit was rescinded, and two units were voted to the Section on Preventive and Industrial Medicine and Public Health.

The Council would call the attention of the House of Delegates to the fact that these allotments of units for each section at the annual session may be changed from year to year. It was the opinion of the Council that when a section, the number of meetings of which had been reduced, demonstrates by increased attendance and a more vital program that more units are warranted, the Council, guided by the attendance and interest shown, may increase the allotment of units to that section. The reverse may also be the case. Inferior programs and poor

attendance will mean less units at the next year's session. The schedule for 1949, therefore, is not rigid, but is subject to review and change each year thereafter.

ANNUAL CONFERENCE OF SECTION SECRETARIES

The Annual Conference of Section Secretaries was held with the Council on Scientific Assembly on Nov. 13, 1948, at the headquarters of the American Medical Association in Chicago, and preparations were made for the usual scheduled section meetings for the 1949 annual session. Those sections which met in the mornings at the annual session in 1948 will meet in the afternoons at the Atlantic City Session.

Respectfully submitted,

HENRY R. VIETS, Chairman.
CHARLES H. PHIFER.
L. W. LARSON.

ERNEST B. HOWARD, Assistant Secretary.

Ex officio.

REPORT OF COUNCIL ON MEDICAL SERVICE

COMMUNITY LEADERSHIP

To the Members of the House of Delegates of the American Medical Association:

Emphasis during 1948 has been placed on community leadership in health problems by county medical societies and to a lesser extent by state medical associations.

Medical Society Surveys.—The first step in community leadership in health problems is to determine the capacity of county medical societies for promoting this leadership. What are the activities of county medical societies? Are they prepared to assume leadership? To answer some of these questions the Council on Medical Service turned directly to the county societies. Contacting all 2,100 component societies was impractical, so that a pilot questionnaire was sent to 250 selected societies in the forty-eight states. The results of the pilot questionnaire are interesting but not too encouraging. Full tabulation has been completed and mimeographed and copies sent to all society secretaries.

As with the component county medical societies, it was necessary to know more about the constituent state medical associations. A questionnaire was forwarded to every state association secretary for the purpose of learning more about activities and work in the health care field.

The information gained from both surveys has enabled the Council to act as a clearing house on medical society activities. The demand for this type of service is continually increasing. Medical societies are rapidly expanding their activities and are anxious to learn of existing experiences. The Council is now in a position to supply information that will assist the societies in developing programs.

Health Councils.—Since the Council on Medical Service first reported to the House of Delegates on health councils in June 1946, the subject has become of widespread interest. This interest has been furthered through the News Letter, regional conferences, a special brochure and correspondence.

Health councils seem to be an excellent medium through which community leadership in health problems may be attained. However, the term health council is used in a variety of ways. It means different things to different persons, and final determination of the use of the term will require further consideration of the entire program.

At present there appear to be three types of general health councils: State health councils, metropolitan health councils and community health councils. The three types are organized in a variety of ways and for a number of different purposes. Best known of the state health councils are those made up of professional groups (such as medical, dental and pharmaceutical), those composed of voluntary health agency representatives and those set up by official action of the state government. Examples of the first are the health councils in Illinois and California, of the second the health councils in Virginia and Vermont and of the third the health council in Indiana.

The metropolitan health councils are those found in cities, usually 50,000 or more in population. These are generally composed of representatives of voluntary health agencies and of the professional societies. Many of them are sponsored and financed by the local community chest agency.

The community, including rural health councils, are probably the latest type to develop. The efforts of the Council on Medical Service in this activity are being coordinated with those of the Committee on Rural Medical Service.

In addition, the term health council is used in a limited sense in connection with school health and public health. There is also a national organization known as the National Health Council which is devoting most of its efforts to the promotion of local health departments or units.

The Council's efforts in this field are primarily devoted to determining the facts, reporting and interpreting these facts to the medical profession and arousing an interest on the part of medical societies in taking a more active part in the work of the health councils.

REGIONAL CONFERENCES

The regional conferences continue to perform a much needed function—the exchange of ideas between the constituent and component medical societies and the American Medical Association. Regional conferences were held in 1948 in Cleveland; Spokane, Wash.; Denver; Philadelphia; Columbia, S. C.; St. Paul, and Tulsa, Okla. A development during 1947-1948 was the joint sponsoring of the regional conferences by the Council on Medical Service, the Council on Industrial Health and the Committee on Rural Medical Service. The purpose of this move is twofold: first, to provide a better picture of the work of the Association and, second, to widen the scope of subjects discussed. If and when the Association funds permit, it is hoped that other councils will find it possible to join in the sponsorship.

NEWS LETTER

The House of Delegates at the 1947 Annual Session recommended "that the Board of Trustees investigate the possibility of extending the news letter mailing list to include all Fellows of the American Medical Association, and if this is impossible that at least it be sent to all officers of component county societies." Inclusion of all Fellows of the Association has not been possible. However, the county medical societies are now receiving the news letter and several state medical associations have offered to mail copies of the news letter to their membership, provided that the Council could supply a sufficient number of copies. The regular mailing list includes approximately 6,000 physicians, auxiliary members and others interested in medical service programs.

SPECIAL PROJECTS

Fund-Raising Groups.—Physicians throughout the nation are feeling the pressure of the increasing demand made on them by the numerous so-called voluntary health organizations. For many years physicians have cooperated with the programs devised by the National Tuberculosis Association, the American Red Cross and the National Association for Crippled Children. Effort has not always been made to devise a program that would be fair to the physician as well as to the public.

More recently the profession has been called on by the American Cancer Society to make its cancer detection program effective. Here, however, the Board of Trustees and the Council on Medical Service of the American Medical Association entered the picture and worked for a realistic policy which included the county medical society and the individual physician. As a result, the American Cancer Society's program has produced many local experiments designed to fit local opinion and needs, with the full approval of the county medical societies. Presently, if the trend continues, the physician will be confronted with even greater demands. Programs are in process by the American Heart Association, the American Diabetes Association and others. In view of this trend, the Council proposes to determine the success that county medical societies have had in serving and coordinating the various programs. Only in this manner will it be possible to set forth sound policies to be used as guide posts for future county medical society relations with voluntary health organizations.

Assistance at the national level would aid materially in protecting the individual physician against undue demands on the part of voluntary health agencies. The Board of Trustees has recognized this in several instances. However, the Council recommends to the House of Delegates that further effort be made to obtain direct representation of the Association on all of the national voluntary health organizations. The Council further believes that it would be helpful to sponsor a coordinating committee, composed of representatives of all such national groups, for the purpose of developing policies applicable at the county medical society level.

GROUP PRACTICE

Interest in group practice has increased during the past two years, particularly among the returning servicemen. The Council has followed the discussions of group practice in the various medical journals.

In June 1947, the House of Delegates approved a resolution referring the study of the question of group practice to the Board of Trustees and suggesting that the Bureau of Medical Economic Research, the Judicial Council, the Council on Medical Service and the Bureau of Legal Medicine and Legislation cooperate in the project. The Board of Trustees, in turn, referred the matter to the Council on Medical Service, requesting the appointment of a subcommittee on group practice. Following these actions the Council requested a conference of headquarters personnel representing the aforementioned groups. At that time the details of the study were given over to the Bureau of Medical Economic Research. Undoubtedly, the Bureau will comment on this in detail in its report.

It is important here to note that when the Trustees referred the question of a group practice study to the Council, they directed the subcommittee and the Judicial Council to draw up standards, although the problem of standards was not considered in the original resolution of the House of Delegates. The Council has discussed at length the possibility of setting standards for group practice and is hesitant to enter into such a project. The Council has, however, requested its subcommittee to keep this problem in mind during the study. Further reports on this subject will be made during or on completion of the study.

COMPULSORY SICKNESS INSURANCE

Public interest in compulsory sickness insurance continues unabated. Requests for information continue to pour in from physicians, students and others preparing speeches and articles or just interested in the subject. The Council wishes to call the attention of the House to a serious situation; that is, to the absence in school, college and public libraries of reference material presenting arguments against compulsory sickness insurance. The Council's correspondence reveals many persons willing to oppose government control of medical care, but handicapped in sources to which they may turn for arguments.

The Council has approached the problem in four ways: first, by maintaining a supply of various reprints and pamphlets for distribution to students, etc.; second, by preparing reference material in bound volume form suitable for library use; third, by making available "loan kits" on the subject for use in cases where detailed reference data are needed, and fourth, by preparing and making available a bibliography on sickness insurance publications.

Literally thousands of articles, pamphlets and speeches are written annually in opposition to government medicine. Most of them are a repetition of nebulous arguments, many of which are thoroughly sound and extremely important but no longer sufficient to satisfy many students, speakers or writers. Basic facts, figures and specific information are too often missing. In an effort to remedy this, the Council staff is reviewing literature on the subject with the view to preparing a series of small booklets suitable to all but the research student. The Council believes that these should be placed in every college, medical school and hospital library. Supplying public and high school libraries is also important, but is too expensive a job for the present.

OTHER PROJECTS

The Council will report in detail in a supplementary report on certain special subjects, that will require current comment, during the Interim Session. Among these are voluntary prepayment medical care plans, union health programs and cash sickness benefits.

STANDARDS OF ACCEPTANCE FOR MEDICAL CARE PLANS

At the 1946 Annual Session the House of Delegates approved the preliminary Standards of Acceptance for Voluntary Prepayment Medical Care Plans as adopted by the Council on Medical Service. At that time, the Council felt that revisions might be desirable from time to time as further information and experience became available.

The Council has constantly maintained that the type and scope of coverage offered by prepayment plans should be subject to the prior approval of constituent and component medical organizations. In keeping with this, it is felt that no one standard should

preclude a locally approved or sponsored plan provided that plan met all other standards.

Certain clarifying amendments have been considered and approved by the Council. The total effect is not changed.

The standards as amended now read as follows:

PROPOSED REVISION OF STANDARDS OF ACCEPTANCE FOR MEDICAL CARE PLANS

Development of plans affecting the distribution of medical care, in accordance with the principles adopted by the House of Delegates, is one of the principal functions of the Council on Medical Service. First in importance in the development of plans affecting the provision of medical care is the utilization of the prepayment method to help spread medical and surgical costs.

The Council on Medical Service suggests that special recognition be granted to plans organized and operated in accordance with standards which adequately protect the interest of the public and the medical profession.

In granting this recognition the Council will consider each prepayment medical care plan in the light of established knowledge, authoritative opinion, and according to standards adopted from time to time by the Council in the interest of the public. Plans that conform with the requirements thus formulated will be accepted by the Council.

The prepayment plan may be underwritten either by voluntary prepayment organizations formed specially for the purpose, or by duly licensed private insurance companies, or by both.

Under the conditions defined in the following paragraphs, the Council grants the right to print its seal on all official papers of accepted plans and in any promotional literature or display material used by these plans.

This official seal should appear without comment on its significance unless such comment has been previously approved by the Council. A statement proposed for such use follows: "the seal of acceptance denotes that (name of plan) has been accepted within the standards set forth by the Council on Medical Service of the American Medical Association."

The acceptance of a plan and the seal of the Council are intended to signify that the plan conforms with or meets the following standards or requirements:

Local Approval: 1. The prepayment plan must have the approval of the state medical association or, if local, of the county medical society in whose area it operates. The state association or county society that sponsors the plan, must retain the right to withdraw its approval and require discontinuance of the use of the seal of acceptance on reasonable notice to the public and to the underwriters.

Professional Responsibility: 2. The medical profession should assume responsibility for the medical services included in the benefits; the medical profession is qualified legally and by education to accept responsibility for the character of the medical services rendered.

(a) The plan should provide for the appointment of a committee by the medical profession in the area served by the plan; one of the duties of this committee shall be the determination of relative values of medical services and procedures as set forth in the plan's published schedule of benefits. The committee may also be authorized to consider difficulties and complaints and make recommendations.

(b) The published schedule of benefits of the plan shall include those services and procedures listed as essential by the Council on Medical Service consistent with the scope of the plan.

Free Choice of Physician: 3. There should be no regulation which restricts free choice of a qualified doctor of medicine in the locality covered by the plan who is willing to give service under the conditions established.

Patient-Physician Relationship: 4. The method of giving the service must retain the personal, confidential relationship between the patient and physician.

Public Policy: 5. The plan should be organized and operated to provide the greatest possible benefits in medical care to the

subscriber. Honesty of purpose and sincere consideration of mutual interests on the part of the subscribers, the physicians and the plans are presupposed as necessary considerations for successful operation.

Type of Benefits: 6. These benefits may be in terms of cash indemnity or medical service. Where benefits are paid in cash to the subscriber it must be clearly stated that these benefits are for the purpose of assisting in paying the charges incurred for medical service and do not necessarily cover the entire cost of medical service, except under specified conditions.

Clarity of Benefits: 7. Subscribers' contracts must state clearly the benefits and conditions under which benefits will be provided. All exclusions, waiting periods, and deductible provisions must be clearly indicated in the promotional literature and in the contracts.

Promotion: 8. Promotional activities must be reasonable without extravagant or misleading statements concerning the benefits to the subscribers. In approving promotional material the Council will endeavor to indicate the type of statements which are acceptable and the nature of those considered objectionable. It is not the function of the Council to edit all copy word for word and sentence for sentence, but rather to indicate the general type of revision required in any given piece of literature. It expects the spirit and intent of such objections to be observed in the remainder of the copy not specifically criticized. Promotional activities will include any devices for informing the public or the profession.

Reports: 9. Each accepted plan must agree to submit reports of financial and enrolment experience in the manner prescribed by the Council.

Safeguards for the Subscriber: 10. The Council will utilize the experience of those plans that are and have been operating successfully as a criterion for judging new plans, but will not discourage experiments in other types of coverage provided such experiments are limited in scope and capable of scientific evaluations. The following principles, however, are laid down as fundamental:

- (a) The dues from subscribers through premium rates should be adequate to provide for the benefits offered and cover the risks involved.
- (b) Enrolment practices shall be based on sound actuarial principles such as will not expose the plan to adverse selection. Group enrolment is recommended until experience warrants the acceptance of individuals.
- (c) It is understood that the plan of organization will conform with state statutes and that the plan will operate on an insurance accounting basis with due consideration for earned and unearned premiums, administrative costs and reserves for contingencies, claims incurred but not paid and unanticipated losses. Each plan must submit reports of financial experience in the manner prescribed by the Council. Supervision should be under the appropriate state authority.
- (d) Provision should be made for a medical director acceptable to the county or state medical society. The medical director may be paid on a per diem basis for the time involved in handling such matters.
- (e) All insurance companies participating in the underwriting of a medical society prepayment plan must be licensed to do business in the state in which the plan is located. Inasmuch as the state insurance authorities supervise the finances and underwriting practices of such companies, the Council will duplicate this function only to the extent it deems necessary.

Duration of Acceptance: Acceptance of plans by the Council will be for a period of two years (provided they comply with the standards during this period) or until revoked. At the end of this period all contracts and financial statements shall be reexamined. A shorter period of approval may be granted at the discretion of the Council. Any changes in contracts or literature during the period of acceptance must be submitted to the Council.

SUGGESTED DEFINITIONS

Methods for improving and for altering the distribution of medical care have been the subject of discussion for many years. These discussions, whether heated debates, partisan declarations or unbiased talks, invariably involve the use of terms the meanings of which are not equally understood by either the listeners or discussants. Even a brief perusal of literature on the subject shows that often the meanings are determined to meet given situations.

Public interest in medical care programs, and therefore in the terms used has reached an all-time high. The American system of medical care is being debated from coast to coast. It is the subject of articles in the leading magazines and of literally thousands of talks and programs.

The Council on Medical Service receives inquiries from all parts of the United States and from all groups of its population. Without exception, the inquiries show confusion as to the meaning of the following terms and the attitude of the American Medical Association toward the methods that these terms involve: socialized medicine; state medicine; sickness insurance; health insurance; compulsory sickness insurance; voluntary medical care insurance; public health; group medical practice; private group clinics, and consumer managed health plans.

In an effort to determine possible definitions of the above terms which might be generally acceptable among the medical profession, the Council has reviewed the books and literature of many authors as well as the actions of the House of Delegates, and has found fairly general agreement on the definitions of all the terms with the exception of the term socialized medicine. The difference of opinion arises in regard to one point and that is whether or not socialized medicine necessarily means government influence or control or whether it merely connotes a form of medical practice in which a method of distributing medical care is made subject to social influences, that is, of groups of persons, the community or the state. Following the opinions of the first group, socialized medicine would be almost synonymous with state medicine. Following the opinions of the second group, socialized medicine would include state medicine, but it would also include the voluntary prepayment plans, sickness insurance, consumer-managed plans, etc.

The term "socialize" according to Webster means "1. To render social, that is, to fit into society; 2. To adapt to social needs or uses such as socializing one's habits, gifts or wealth; 3. To render socialistic in nature or to conform to the theories or practices of socialism." If one accepted either of the first two definitions, then socialized medicine could be used as a general over-all term. However, if one accepts the third definition of Webster, the term socialized medicine might better be limited to government or state medicine. However, in arriving at a set of suggested definitions the Council has leaned primarily on popular usage rather than the dictionary. Most physicians and laymen use the term socialized medicine in referring to government influence or control over medical practice. Rather than try to change the popular conception of the term, the Council has tried to adapt definitions to that conception. Under these definitions, socialized medicine includes state medicine, per se, and compulsory sickness insurance when it is under the direct control of the state. Voluntary sickness insurance is not socialized medicine under the suggested definition nor is group medical practice nor the private group clinics.

The following definitions are submitted to the House of Delegates for consideration:

Socialized Medicine.—Socialized medicine is a system of medical administration by which the government promises or attempts to provide for the medical needs of the entire population or a large part thereof.

State Medicine.—State medicine is a form of socialized medicine in which the government attempts to provide medical services directly to the general population from funds established by taxation. The physicians become employees of the state and medical practice becomes subject to the directives of the third party.

Sickness Insurance.—Sickness insurance is ostensibly a method of transferring the economic burden of sickness from the individual to the group. Sickness insurance may be voluntary or compulsory.

Compulsory Sickness Insurance.—Compulsory sickness insurance is a system of sickness insurance in which all members of a given group of persons in a given governmental area are compelled by law to contribute to and be enrolled in the scheme. Any compulsory sickness insurance program under direct control of the state is socialized medicine, insurance principles no longer prevail and the compulsory contributions become a special tax.

Voluntary Sickness Insurance.—Voluntary sickness insurance is that system whereby individual costs are spread over a period of time by a group of people who voluntarily band together to protect themselves against the economic burden of sickness. It involves the insurance principle and an organized system of payment. It is popularly known as voluntary prepayment medical care insurance.

Public Health.—Public health includes those arrangements whereby the government provides medical services for special groups of persons and undertakes activities which are concerned with the protection of the health of the people as a whole. Public health is concerned with persons requiring institutionalized care, with those who are wards of the government, with the indigent, with proper sanitation, and with the control and prevention of communicable diseases.

Health Insurance.—Health insurance is used interchangeably with sickness insurance and usually means the same thing. It may be voluntary or compulsory, although national health insurance usually means compulsory sickness insurance.

Group Medical Practice.—Group Medical Practice is the application of medical service by a number of physicians working in systematic association with the joint use of equipment and technical personnel and with centralized administration and financial organization.

Private Group Clinics.—The term private group clinics applies to organizations owned and managed by one or more physicians offering medical services. Services are usually supplied by a number of physicians who practice as a group, using joint office facilities and equipment. The physicians are under the supervision of a medical director.

WASHINGTON OFFICE

The special session of Congress adjourned without taking up any matters of importance to the medical profession. During the recess the staff of the Washington office is afforded more time to develop a working liaison with all federal agencies and bureaus dealing with medicine. These agencies welcome the cooperation extended and are very anxious to make available any information desired. As the program progresses, more and more requests to attend public relations and press conferences are received.

At the present time most federal departments are standing by. Few are developing any new policies or plans for several reasons. Outstanding among these is the study being made by the Hoover Commission. The Hoover Commission has begun its monumental task of collating the information it has accumulated. It is expected that out of these surveys, ways to cut the cost of government may be effected. Some of the indicated recommendations to be made include additional assistants to the President, more responsibility placed on the Vice President, an enlarged cabinet to assimilate the scattered agencies and reorganization of the structure of the Veterans Administration and National Military Establishment.

The departments of the Army and the Air Force, through their technical service offices, are developing a large scale promotional plan for recruiting physicians. Their needs seem to be more pressing since the principal responsibility of the draft law has been placed on them.

The department of the Navy has developed a two fold program for the procurement of physicians and dentists—a long range program which involves legislation that must await the new Congress, and a short range plan which is administrative and provides for a series of training and internship plans.

The Public Health Service announced the establishment of the National Heart Institute together with its advisory committee and the National Institute of Dental Health. The

institutes will be located in Bethesda, Maryland. The National Advisory Heart Council held an organizational meeting at which time plans were made to lay a broad attack on heart disease, support research and training and aid states in the development of community educational programs. A second meeting will be held some time in December. Unlike other councils, this Council has a lay representation as well as a professional.

The National Cancer Institute announced grants of more than \$1,300,000 to finance cancer control and research work in twenty-six states, the District of Columbia, Puerto Rico, Canada and France. The grants were made to forty-six laboratory and clinical research projects, five construction projects, twenty special control projects, nine medical schools to improve cancer teaching courses, and eight dental schools for teaching oral cancer diagnosis. Since the beginning of the program less than a year ago, more than one hundred medical and dental schools have qualified for financial aid. All but twelve of the recognized medical and dental schools are receiving grants from the Cancer Institute.

The Employee Health Program, as provided under Public Law number 659 enacted by the 79th Congress, is well under way with the opening of the first major plan at the Denver Federal Center. Since the beginning of the program surveys have been completed in Denver, Kansas City, Chicago and New Orleans. A survey is now in progress in Boston. In Washington, D. C., there are 125 health units coordinated under this law, some operated through contractual agreement by the Public Health Service and others operated by the individual federal departments.

There are plans in the making to remove certain obstacles of the basic act of the Public Health Service which have been found to be inoperative and administratively unwise. Existing language establishing the various advisory councils of the institutes is to be revised to provide lay representation as well as professional, similar to the councils that were established in conjunction with the heart and dental institutes.

A member of the staff of the Washington office assisted the Bureau of Medical Economic Research in checking statistics used in preparation of one of its reports, and at the request of the Bureau of Legal Medicine and Legislation discussed with the Bureau of Employees' Compensation the feasibility of changing existing law to provide for choice of physician for injured personnel of the federal government. The latter bureau is also being assisted in the collection of information relative to medical service fees and fee schedules paid to civilian physicians by the various government agencies.

Some interesting reports soon to be released, or that have been released recently, are the Gray Report on Civilian Components (the findings of a committee appointed by the Secretary of Defense to make "a comprehensive, objective and impartial study of the reserve forces of the armed forces"), the report of the Civilian Defense Planning Board, and a study which is being conducted by the Technical Services of the Army in conjunction with the Troop Attitude Research on the Medical Department of the Army.

When Mr. Ewing distributed his report to the President, "The Nation's Health," he presented the Washington office with 25 copies from which a copy was mailed to each member of the Council and the Board of Trustees.

Respectfully submitted.

CONFERENCE ON NATIONAL MEDICAL PUBLIC RELATIONS

Hotel Statler, St. Louis

SATURDAY, NOV. 27, 1948

Registration: 11:00 a. m.

LUNCHEON SESSION:

GEORGE F. LULL, Chicago, Presiding

12:00 noon. Welcome to Public Relations Delegates.

1:05 p. m. Conference Observations.

LAWRENCE W. REMBER, Chicago.

1:15 p. m. The Public Speaks on Health.

CLAUDE ROBINSON, President, Opinion
Research Corporation, Princeton, N. J.

1:45 p. m. Announcements Regarding the Afternoon
Workshop Session Topics and Place of
Meeting.

PROBLEM CLINIC

WORKSHOP SESSION:

2:00 p. m. Selling the Need for Public Relations to the
Medical Profession.

LESTER H. PERRY, Harrisburg, Pa.

2:25 p. m. Using Public Relations to Promote Medical
Prepayment Plans.

CHARLES G. HAYDEN, Boston.

2:50 p. m. Setting Up a Workable System for Handling
Night Calls.

THEODORE WIPRUD, Washington, D. C.

3:15 p. m. Intermission.

3:30 p. m. The Rebate Problem.

CLEM WHITAKER, San Francisco.

3:55 p. m. How to Develop Good Will with Labor,
Farm and Industrial Groups.

C. H. CROWNHART, Madison, Wis.

4:20 p. m. Cooperating with Health Agencies.

HENRY S. JOHNSON, Richmond, Va.

Question and Answer Period will follow each
of the above six topics.

4:45 p. m. Five Minute Survey of Workshop Session.

4:50 p. m. Intermission.

SOCIAL AND DINNER SESSION:

ELMER L. HENDERSON, Louisville, Ky., Presiding.

5:30 p. m. Cocktails and Entertainment.

6:45 p. m. Dinner at which Special Guests will be
Introduced.

8:00 p. m. Summary of Conference Accomplishments.

8:05 p. m. Yes, the Profession Needs PR.

R. L. SENSENICH, South Bend, Ind.

8:10 p. m. What Public Relations Did for Us.

CONGER REYNOLDS, Director of Public Rela-
tions, Standard Oil Company of Indiana,
Chicago.

9:00 p. m. Adjournment.

ANNUAL CONFERENCE OF STATE SECRETARIES AND EDITORS

Hotel Statler, St. Louis

NOV. 28 AND 29, 1948

SUNDAY, NOV. 28, 1948

9:00 a. m. Registration.

10:00 a. m. Legislation, American Medical Association,
State and Government.

11:00 a. m. Osteopathy in Its Relationship to Medicine.

12:00 noon Intermission for Luncheon.

2:00 p. m.—4:30 p. m. Round Table Discussion.

(a) Medical Association Radio Programs.

(b) Legislation.

(c) Prepayment Medical Care Plans.

5:00 p. m. Intermission.

7:00 p. m. Dinner Meeting: "Clinic" on State Medical
Journals.

(a) Editorial Content.

(b) Editorial Format and Makeup.

MONDAY, NOV. 29, 1948

9:30 a. m. General Session.

Roundup on Prepayment Plans.

Ten Minute Reports by Moderators of Round
Table Discussions.

Emergency Medical Service.

GRASS ROOTS CONFERENCE

Crystal Room, Jefferson Hotel

TUESDAY, DEC. 1, 7:00 p. m.

A. M. MITCHELL, Terre Haute, Ind., Chairman

7:00 p. m. Registration.

7:30 p. m. Panel I: Relation of the Doctor to National
Preparedness.

Guest Speakers to present:

1. The Point of View of the Armed
Services.

2. The Point of View of the Medical
Profession.

Open Question and Answer Period.

8:45 p. m. Panel II: The Public, the Doctor and
"Socialized Medicine."

Guest Speakers to present:

1. Implications of the National Health
Assembly and the Ewing Report.

2. Facts from the Brookings Institution
Report.

3. Results of European Experiences.

Open Question and Answer Period.

SCIENTIFIC PROGRAM

Municipal Auditorium

TUESDAY, NOV. 30, 1948

GENERAL LECTURES

IN OPERA HOUSE

2:00 p. m. Present Day Status of the Treatment of
Hypertension.

IRVINE H. PAGE, Cleveland.

2:30 p. m. The Management of Prolonged Labor.

RALPH REIS, Chicago.

3:00 p. m. Intermission.

CLINICAL PRESENTATIONS

IN ROOM 5-1: OBSTETRICS

3:30 p. m. Breech Delivery (Mannikin).

THOMAS M. MIER, St. Louis.

4:00 p. m. The Normal and Abnormal Third Stage of
Labor.

T. K. BROWN, St. Louis.

4:30 p. m. Roentgen Ray Pelvimetry.

RUSSELL L. NICHOLS, Chicago.

IN ROOM S-2: POLIOMYELITIS

- 3:30 p. m. The Care of the Poliomyelitis Patient in the Acute Stage.
THOMAS GUCKER III, SHIRLEY COGLAND and THERESA FALLON, The Children's Hospital, Boston.
- 4:00 p. m. The Care of the Poliomyelitis Patient in the Convalescent Stage.
ROBERT L. BENNETT, HELEN VAUGHN and CHARLOTTE STEITZ, Georgia Warm Springs Foundation, Warm Springs, Ga.
- 4:30 p. m. The Care of the Poliomyelitis Patient in the Final Rehabilitation Stage.
HOWARD A. RUSK, GEORGE G. DEEVER, DONALD A. COVALT, MILDRED ELSON and BARBARA WHITE, New York University, Department of Rehabilitation and Physical Medicine, New York.

IN ROOM S-3: ARTHRITIS

- 3:30 p. m. Rheumatoid Arthritis
DONALD F. HILL, Tucson, Ariz.
- 4:00 p. m. Osteoarthritis EVAN M. BARTON, Chicago.
- 4:30 p. m. Miscellaneous Rheumatic Diseases.
EDWARD F. ROSENBERG, Chicago.

IN ROOM S-6: CANCER

- 3:30 p. m. Radical Neck Dissection for Cancer of the Buccal Cavity and Lip.
JAMES B. BROWN and FRANK McDOWELL, St. Louis.
- 4:00 p. m. A Radical Operation for Cancer of the Breast.
WILLIAM E. LIGHTON and JOHN S. SCIORTINO, St. Louis.
- 4:30 p. m. Transvaginal X-Radiation for Cancer of the Uterine Cervix.
A. N. ARNESON and SHERWOOD MOORE, St. Louis.

IN ROOM S-7: ROENTGEN DIAGNOSIS

EDWIN C. ERNST, St. Louis, Presiding

- 3:30 p. m. The Uses and Abuses of Fluoroscopy with a Discussion of the Interpretation of Chest Films.
IRA H. LOCKWOOD, Kansas City, Mo.
- 4:00 p. m. Rectal Bleeding and What Should Be Done to Determine Its Cause.
GEORGE M. WYATT, Washington, D. C.
- 4:30 p. m. Cancer of the Lung: Its Appearance on the X-Ray Film and What Is Necessary to Establish a Diagnosis.
JAMES DOUGLAS, Louisville, Ky.

IN ROOM S-8: LABORATORY DIAGNOSIS

ROBERT A. MOORE, St. Louis, Presiding

- 3:30 p. m. Renal Function Studies in the Diagnosis of Diseases of the Kidney.
F. WILLIAM SUNDERMAN, Cleveland.
- 4:00 p. m. The Cytologic Diagnosis of Early Cancer.
JOHN B. FRERICH, St. Louis.
- 4:30 p. m. Determination of Prothrombin with Particular Reference to the Use of Anticoagulants in Therapy. E. D. WARNER, Iowa City.

IN ROOM S-10: HYPERTENSION

- 3:30 p. m. Rehabilitation: Its Place in the Management of Cardiovascular Problems.
HOWARD A. RUSK, New York.
- 4:00 p. m. Cerebral Complications of Hypertension.
G. WILSE ROBINSON, Kansas City, Mo.

4:30 p. m. Peripheral Vascular Disease.

E. V. ALLEN, Rochester, Minn.

There will also be demonstrations from 3:00 p. m. to 5:30 p. m. in the Exhibit on Diabetes in the Scientific Exhibit by Drs. H. F. Root, Boston, and W. H. Olmsted, St. Louis.

WEDNESDAY, DEC. 1, 1948

GENERAL LECTURES

IN OPERA HOUSE

- 9:00 a. m. The Role of the General Practitioner in Child Health Care.
HUGH McCULLOCH, St. Louis.
- 9:30 a. m. Diagnosis and Control of Disease.
FRANK W. KONZELMANN, Atlantic City, N. J.
- 10:00 a. m. Intermission.

IN ASSEMBLY ROOM 1

- 2:00 p. m. Arthritis.
EDWARD F. ROSENBERG, Chicago.
- 2:30 p. m. A Résumé of the Skin Diseases That Are Most Commonly Seen in General Practice.
EVERETT C. FOX, Dallas, Texas.
- 3:00 p. m. Intermission.

CLINICAL PRESENTATIONS

IN ROOM S-1: PEDIATRICS

- 10:30 a. m. Problem of Nutrition in the Sick Infant.
PETER G. DANIS, St. Louis.
- 11:00 a. m. Management of the Newborn Infant.
JOSEPH C. JAUDON, St. Louis.
- 11:30 a. m. Practical Consideration of Mental Health of the Child.
ALFRED S. SCHWARTZ, St. Louis.
- 12:00 noon. Intermission.

OBSTETRICS

- 3:30 p. m. Induction of Labor.
MELVIN A. ROBLEE, St. Louis.
- 4:00 p. m. Dystocia Due to Pelvic Neoplasms.
SIM B. LOVELADY, Rochester, Minn.
- 4:30 p. m. Treatment of Asphyxia of the Newborn.
JOSEPH A. MCNEARNEY, St. Louis.

IN ROOM S-2: POLIOMYELITIS

- 10:30 a. m. The Care of the Poliomyelitis Patient in the Acute Stage.
THOMAS GUCKER III, SHIRLEY COGLAND and THERESA FALLON, The Children's Hospital, Boston.
- 11:00 a. m. The Care of the Poliomyelitis Patient in the Convalescent Stage.
ROBERT L. BENNETT, HELEN VAUGHN and CHARLOTTE STEITZ, Georgia Warm Springs Foundation, Warm Springs, Ga.
- 11:30 a. m. The Care of the Poliomyelitis Patient in the Final Rehabilitation Stage.
HOWARD A. RUSK, GEORGE G. DEEVER, DONALD A. COVALT, MILDRED ELSON and BARBARA WHITE, New York University, Department of Rehabilitation and Physical Medicine, New York.

12:00 noon. Intermission.

- 3:30 p. m. The Care of the Poliomyelitis Patient in the Acute Stage.
THOMAS GUCKER III, SHIRLEY COGLAND and THERESA FALLON, The Children's Hospital, Boston.

- 4:00 p. m. The Care of the Poliomyelitis Patient in the Convalescent Stage.
ROBERT L. BENNETT, HELEN VAUGHN and CHARLOTTE STEITZ, Georgia Warm Springs Foundation, Warm Springs, Ga.
- 4:30 p. m. The Care of the Poliomyelitis Patient in the Final Rehabilitation Stage.
HOWARD A. RUSK, GEORGE G. DEEVER, DONALD A. COVALT, MILDRED ELSON and BARBARA WHITE, New York University, Department of Rehabilitation and Physical Medicine, New York.

IN ROOM S-3: DIABETES

- 10:00 a. m. Management of the Newly Discovered Diabetic Patient.
E. PAUL SHERIDAN, Denver.
- 10:30 a. m. Control of Juvenile Diabetics.
JULIAN D. BOYD, Iowa City.

- 4:30 p. m. Radioactive Phosphorus Therapy of Chronic Leukemia.
EDWARD H. REINHARD, St. Louis.

IN ROOM S-7: JAUNDICE

- 10:30 a. m. Portal Cirrhosis.
G. O. BROUN, St. Louis.
- 11:15 a. m. Homologous Serum Jaundice.
BRUCE D. KENAMORE, St. Louis.

12:00 noon. Intermission.

- 3:30 p. m. Cancer of Hepatic Ducts and Portal Thrombosis as a Cause of Jaundice.
BARRETT L. TAUSSIG, St. Louis.
- 4:15 p. m. Infectious Hepatitis.
HAROLD SCHEFF, St. Louis.

IN ROOM S-8: LABORATORY DIAGNOSIS

HOLLIS N. ALLEN, St. Louis, Presiding

- 10:30 a. m. Histoplasmosis.
PARKER R. BEAMER, St. Louis.
- 11:00 a. m. The Differential Diagnosis of Jaundice by Laboratory Methods.
FRANK W. KONZELMANN, Atlantic City, N. J.
- 11:30 a. m. Hypoglycemic and Hyperglycemic States.
PAUL CUTLER, Atlantic City, N. J.

12:00 noon. Intermission.

SAM GRAY, St. Louis, Presiding

- 3:30 p. m. The Leukocyte in Disease.
GUSTAVE J. DAMMIN, St. Louis.
- 4:00 p. m. The Red Blood Cell in Anemia.
ARTHUR H. SANFORD, Rochester, Minn.
- 4:30 p. m. The Spinal Fluid in Disease.
R. O. MUETHER, St. Louis.

IN ROOM S-10: HEMATURIA

E. L. KEYES, St. Louis, Presiding

- 10:30 a. m. Radiographic Studies.
R. LEE HOFFMANN, Kansas City, Mo.
- 11:00 a. m. Lower Urinary Tract Lesions Producing Hematuria.
THOMAS MOORE, Memphis, Tenn.
- 11:30 a. m. Upper Urinary Tract Lesions Producing Hematuria.
ELMER HESS, Erie, Pa.

12:00 noon. Intermission.

HEART

- 3:30 p. m. Nutritional Factors in Chronic Cardiovascular Disease.
TOM D. SPIES, Birmingham, Ala., and ROBERT S. STONE, San Francisco.

- 4:00 p. m. Management of the Hypertensive Heart.
GEORGE R. IHRMANN, Galveston, Texas.
4:30 p. m. Anticoagulant Therapy in Coronary Occlusion.
E. STURLING NICHOL, Miami, Fla.

FRIDAY, DEC. 3, 1948

GENERAL LECTURES

IN OPERA HOUSE

- 9:00 a. m. Cancer. C. P. RHODANS, New York.
9:30 a. m. Diabetes. E. P. JOSLIN, Boston.

CLINICAL PRESENTATIONS

IN ROOM S-1: PEDIATRICS

- 10:30 a. m. Practical Consideration of the Endocrine Problem of Childhood.
MAX DEUTCH, St. Louis.
11:00 a. m. Recent Advances in Immunization Procedures.
JEAN V. J. COOKE, St. Louis.
11:30 a. m. Points in Diagnostic Pediatric Radiology.
DON C. WEIR, St. Louis.

IN ROOM S-2: POLIOMYELITIS

- 10:30 a. m. The Care of the Poliomyelitis Patient in the Acute Stage.
THOMAS GUCKER III, SHIRLEY COGLAND and THERESA FALLON, The Children's Hospital, Boston.
11:00 a. m. The Care of the Poliomyelitis Patient in the Convalescent Stage.
ROBERT L. BENNETT, HELEN VAUGHN and CHARLOTTE STEITZ, Georgia Warm Springs Foundation, Warm Springs, Ga.
11:30 a. m. The Care of the Poliomyelitis Patient in the Final Rehabilitation Stage.
HOWARD A. RUSK, GEORGE G. DEEVER, DONALD A. COVALT, MILDRED ELSON and BARBARA WHITE, New York University, Department of Rehabilitation and Physical Medicine, New York.

IN ROOM S-3: ARTHRITIS

- 10:30 a. m. Rheumatoid Arthritis.
DONALD F. HILL, Tucson, Ariz.
11:00 a. m. Rheumatoid Spondylitis.
CHARLES J. SMYTH, Eloise, Mich.
11:30 a. m. Gout.
HOWARD F. POLLEY, Rochester, Minn.

IN ROOM S-6: DERMATOLOGY

- A. W. CONRAD, St. Louis, Presiding
10:30 a. m. Contact Dermatitis.
W. A. SHOWMAN, Tulsa, Okla.

- 11:00 a. m. Psoriasis and Seborrhea.
ROY L. KILE, Cincinnati.
11:30 a. m. Lupus Erythematosus.
JOHN H. LAMB, Oklahoma City.

IN ROOM S-7: JAUNDICE

- 10:30 a. m. Liver Biopsies.
W. A. KNIGHT, St. Louis.
11:15 a. m. Summary of Clinical Presentations.
SIDNEY A. PORTIS, Chicago.

IN ROOM S-8: LABORATORY DIAGNOSIS

- JOHN A. SAXTON, St. Louis, Presiding
10:30 a. m. The Leukocyte in Disease.
GUSTAVE J. DAMMIN, St. Louis.
11:00 a. m. The Red Blood Cell in Anemia.
ARTHUR H. SANFORD, Rochester, Minn.
11:30 a. m. The Spinal Fluid in Disease.
R. O. MUETHER, St. Louis.

IN ROOM S-10: HEMATURIA

- LOUIS H. JORSTAD, Presiding
10:30 a. m. Treatment of Hematuria Associated with Infection.
WILLIAM N. WISHARD JR., Indianapolis.
11:00 a. m. Hematuria Associated with Stone and Obstruction.
ROY B. HENLINE, New York.
11:30 a. m. Hematuria Associated with Tumor.
JAMES C. SARGENT, Milwaukee.

There will also be demonstrations from 10:00 a. m. to 12:00 noon in the Exhibit on Diabetes in the Scientific Exhibit by Drs. Elliott P. Joslin and Allen P. Joslin, Boston, and Daniel L. Sexton, St. Louis.

TELEVISION

TUESDAY, Nov. 30, 1948

- 2:00 p. m.—3:15 p. m. Medical Clinic, Firmin Desloge Hospital.
3:15 p. m.—4:00 p. m. Operative Clinic, Firmin Desloge Hospital.

WEDNESDAY, DEC. 1, 1948

- 9:30 a. m.—12:00 noon. Operative Clinic, St. Mary's Hospital.
2:00 p. m.—3:15 p. m. Medical Clinic, St. Mary's Hospital.
3:15 p. m.—4:00 p. m. Operative Clinic, St. Mary's Hospital.

THURSDAY, DEC 2, 1948

- 9:30 a. m.—12:00 noon. Operative Clinic, Barnes Hospital.
2:00 p. m.—4:00 p. m. Operative Clinic, Barnes Hospital.

FRIDAY, DEC 3, 1948

- 9:30 a. m.—12:00 noon. Medical Clinic, Barnes Hospital.

ENTERTAINMENT AT THE ST. LOUIS SESSION

An unusual feature of the St. Louis session is an evening devoted entirely to entertainment with an exceptional program.

Physicians registered at the session, their wives and members of their families will be admitted. Admission will be exclusively by ticket. Tickets will be issued at the time of registration.

The entertainment will be several hours in length. People will not be seated after the program once begins. It is scheduled to begin at 7:30 p. m.

The distinguished cast of entertainers are being flown from Hollywood and New York especially for this program and will leave St. Louis immediately thereafter.

The program will include:

Bob Hawk, Master of Ceremonies and Quizmaster, and *Vaughn Monroe* and his orchestra from New York.

Red Foley, *Minnie Pearl* and *Rod Brasfield* from Nashville, Tenn.

Jimmy Durante and *Allan Young* from Hollywood, Calif.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit will be located in the Main Exhibition Hall of Kiel Auditorium (St. Louis Public Auditorium), adjacent to the general registration desks, the technical exhibit and the clinical presentations.

Exhibits pertaining to the clinical presentations will be grouped in front of each of the clinical rooms.

The Scientific Exhibit will open Tuesday noon, November 30, and will close at 12:00 noon, Friday, December 3.

Committee on Scientific Exhibit.

DWIGHT H. MURRAY, Chairman

E. J. McCORMICK

GUNNAR GUNDERSEN

MORRIS FISHBLIN, ex officio

GEORGE F. LULL, ex officio

THOMAS G. HULL, Director

IRENE A. KOENEKE, V. E. CHESKY, G. A. WESTFALL, L. E. PECKENSCHNEIDER and THOMAS L. FOSTER, The Hertzler Research Foundation, Halstead, Kan.:

Conservative Pelvic Surgery in the Female: Moulages show circulation of the female pelvis and maintenance of this circulation in conservative operations on the uterus and ovaries. The relation of genital and urinary problems is presented, based on the symptoms and observations in 1,000 cystoscopic examinations on the female. The effect of castration and the accompanying psychiatric problems are depicted.

LEO J. HARTNETT, St. Louis University School of Medicine, St. Louis:

Arterial Visualization of the Placental Site: Aortography offers a method of directly visualizing the maternal circulation over the placental site. This exhibit demonstrates the placental location through the use of roentgenograms. The entire operative procedure is shown by posters, including indications, contraindications and complications. Roentgen evidence of some complications is shown also.

NATIONAL FOUNDATION FOR INFANTILE PARALYSIS, INC., New York, with the assistance of the Georgia Warm Springs Foundation, Warm Springs, Ga.:

Treatment of Poliomyelitis: The seven stages of treatment of poliomyelitis are shown: (1) save patient's life, (2) prepare for motion, (3) coordinate function and increase strength, (4) increase functional activity, (5) evaluate functional capacity, (6) return home and (7) orthopedic surgery and assistive appliances. Clinical demonstrations will be carried on in an area adjoining the exhibit.

PAUL F. FLETCHER, St. Louis University School of Medicine, St. Louis:

Abdominal Colpo-Cystopexy for Complete Prolapse of Vagina, Bladder and Uterus—Rectus Suspension Principle of Crossed-Suspender Support: The exhibit presents the rectus suspension principle of operative treatment for complete prolapse of the bladder and vagina following hysterectomy and for selected cases of complete uterine procidentia. Living fascial strips mobilized from the anterior rectus sheaths are employed in such a manner as to effect permanent restoration of normal anatomic relationships of these viscera in the pelvis. Analysis of results obtained in both types of cases based on follow-up observations for periods of two to eight years are included.

HUGH L. C. WILKERSON, MALCOLM J. FORD and DONALD HARTING, U. S. Public Health Service, Diabetes Section, Boston:

Simplified Case Finding in Diabetes Control: New developments in diabetes case finding are presented, with a new rapid screening blood glucose test. Blood sugar values on 2,000 "normal" persons from Brookline, Mass., are shown, and the relation to time elapsed since the last meal is indicated. A study of the incidence of diabetes in relatives of a known group of diabetic persons in Jacksonville, Fla., is presented. Physicians

are invited to have screening blood glucose tests or they may actually perform the tests themselves.

HOWARD F. ROOT, ELLIOTT P. JOSLIN, PRISCILLA WHITE, ALEXANDER MARBLE, ALLEN P. JOSLIN and HERBERT H. MARKS, George F. Baker Clinic, New England Deaconess Hospital and Metropolitan Life Insurance Company, Boston and New York:

Diabetes Mellitus in Camp, Home and Hospital: Placards present information about new diabetes camps for children, treatment of diabetes complicated by pregnancy, coma and surgical treatment and new data on factors influencing mortality rates.

HUGH L. C. WILKERSON, Diabetes Section, U. S. Public Health Service, JOSEPH H. BARACH and FRANK N. ALLAN, Boston and B. Y. GLASSBERG, St. Louis, American Diabetes Association:

Diabetes in the United States: The activities of the American Diabetes Association in helping physicians and patients to meet the problems of diabetes are presented. The results of the diabetes program of the U. S. Public Health Service are demonstrated, with statistics on the incidence of diabetes as revealed by the case finding study in Oxford, Mass.

WILLIAM S. COLLENS, NATHAN D. WILENSKY, LOUIS C. BOAS, JAMES D. ZILINSKY and JEROME J. GREENWALD, Maimonides Hospital, Brooklyn:

Complications of Diabetes Mellitus: The exhibit consists of color prints and charts depicting the following complications of diabetes mellitus; insulin lipoatrophy, lipohypertrophy, peripheral neuropathy, Kimmelstiel-Wilson syndrome, acute arterial thrombosis, varieties of gangrene, xanthromatoses and vitamin deficiency states. The diagnostic and therapeutic aspects of these conditions are stressed.

DONALD F. HILL, W. PAUL HOLBROOK, CHARLES A. L. STEPHENS JR., LEO J. KENT and EDNA MCCARTHY, Tucson, Ariz.:

Treatment of Rheumatoid Arthritis: The treatment of rheumatoid arthritis is presented with basic outline, optional, doubtful and worthless methods. Emphasis is given to prevention and correction of deformity with pictures, roentgenograms, charts and demonstrations. Special attention to knee contractions and correction with manipulation in approximately 70 cases is included.

R. S. HENCH, R. K. GHORMLEY and E. F. ROSENBERG,* Mayo Clinic, Rochester, Minn.:

Types of Rheumatic Diseases: The exhibit presents a summary of the pathologic features together with characteristic clinical and roentgenologic changes of the commoner rheumatic diseases, such as rheumatoid arthritis, gout, gonorrheal and other specific arthritides, fibrositis, hypertrophic arthritis, Heberden's nodes, Charcot's joints, tuberculous arthritis and osteochondromatosis. Each type of disease is illustrated by means of clinical photographs, roentgenograms, histologic preparations and moulages.

HOWARD F. POLLEY and DONALD J. ERICKSON, Mayo Clinic, Rochester, Minn.:

Physical Medicine in Arthritis: This exhibit deals with the employment of physical procedures for rehabilitation of persons having arthritis.

WILLIS E. BROWN, OTTO F. KRAUSHAAR and J. T. BRADBURY, State University of Iowa, Iowa City:

Cytology in the Detection of Cancer—Results of a Survey in 4,000 Women Over 30 Years of Age: The exhibit contains six panels of transilluminated Kodachrome photomicrographs of normal and cancer cells in smears stained by the Papanicolaou

* Fellow in Medicine at the Mayo Foundation from Oct. 1, 1935 to June 1, 1942.

technic. In addition to adenocarcinomas and epidermoid carcinomas of the cervix and uterus, examples of pulmonary and renal malignant growths are also included. The summary of a survey of about 4,000 vaginal smears is presented in graphic form. It is presented to show the correlation of cytologic observations with those of biopsy specimens and clinical examinations.

CHARLES F. SHERWIN, St. Louis University School of Medicine, St. Louis:

Tumor of the Face and Eyelids: Photographs and transparencies of various common and unusual tumors and allied conditions noted about the face and eyelids with notations as to treatments and after-results. Special emphasis will be given to types of lesions that could easily be managed by the general practitioner who does a moderate amount of surgical work.

CHARLES F. SHERWIN and ASSOCIATES, Cancer Control Committee, St. Louis University School of Medicine, St. Louis:

Typical 5-Year Survivors of Histologically Proven Cancer—Illustrative Case Reports: Seven case histories are given, together with photographs and photomicrographs as follows:

Case 1.—*Melanoma of Conjunctiva with Preauricular Metastases:* EDWIN J. CASEY, LEGRAND D. SPENCER and CHARLES F. SHERWIN.

Case 2.—*Carcinoma of Cervix Uteri.* W. VOGT Sr. and LEROY SANTI.

Case 3.—*Carcinoma of Skin About Ear.* CHARLES F. SHERWIN.

Case 4.—*Carcinoma of the Rectum.* W. K. MCINTYRE and R. J. MCGANN.

Case 5.—*Carcinoma of the Stomach.* L. RASSIEUR and L. T. MOORE.

Case 6.—*Carcinoma of the Lower Lip.* G. V. STRYKER.

Case 7.—*Carcinoma of the Breast.* W. E. LEIGHTON, L. T. MOORE and J. ERNEST JENSEN.

EDWIN C. ERNST, Barnard Free Skin and Cancer and DePaul Hospitals, St. Louis:

Improved Radium Technic in the Treatment of Carcinoma of the Cervix—Preliminary Clinical Results Compared and Analyzed: The advantages of uniform distribution of multiple sources of radium in the treatment of carcinoma of the cervix are illustrated by means of Kodachrome reproductions of actual cervical lesions during various stages of treatment and variable dosages. Recently developed radium measurement charts and graphs further illustrate the need for improved distribution and more accurate dosage application methods. The clinical application of various radium methods is illustrated and the respective clinical results shown on Kodachrome photographs before and after radium therapy procedures.

STANLEY E. LAWTON, CHARLES E. FILDES, LEON SEIDMAN and ROBERT SCHIREK, University of Illinois College of Medicine and Hines Hospital, Chicago:

Cancer of the Stomach: The exhibit emphasizes the extreme importance of early diagnosis and early treatment of carcinoma of the stomach. It depicts by use of charts, drawings, roentgenograms and pathologic specimens the results of a study of 1,004 cases admitted from many different states. Difficulties of early diagnosis are pointed out and methods evaluated, and the great responsibility for employment of every possible diagnostic means by the first physician who sees the patient is stressed.

FREDERICK H. FALLS, University of Illinois College of Medicine and CHARLOTTE S. HOLT, Illinois State Department of Public Health, Chicago:

Carcinoma of the Uterus: Charts, models, drawings and graphs depict carcinoma of the cervix and body of the uterus. Particular emphasis is placed on the pathologic aspects, gross and microscopic, and on the associated pathologic aspects. Etiologic factors are pointed out and diagnostic procedures for the

detection of early carcinoma are described. Methods of treatment are shown, together with statements concerning the results of such treatment.

NATIONAL CANCER INSTITUTE, Bethesda, Md.:

Environmental Cancer: The exhibit includes a four unit display showing causes and control of environmental cancer. (1) Some Causes of Cancer Are Known—a diagrammatic section through the human body, showing 11 organs and 7 carcinogenic factors affecting them and four routes of exposures. (2) Varied Aspects of Environmental Cancer—including radioactive substances and x-rays as variation by type of contact; hydrocarbons as variation by occupation and solar rays as variation by level of intensity. (3) Case History: Aromatic Amines in a Dye Plant—showing factory with carcinogenic focus and figurines in plastic, showing percentage of cancer in carcinogenic operation, department, plant, county and state and (4) Control of Environmental Cancer—illustrating six control factors of environmental cancer.

EVARTS A. GRAHAM, THOMAS H. BURFORD and LAUREN A. ACKERMAN, Washington University School of Medicine, St. Louis:

Bronchiogenic Carcinoma: The exhibit illustrates frequency and types of bronchiogenic carcinoma. Methods used in diagnosis and treatment are shown and modern results are indicated.

A. C. CHRISTIE, FRED O. COE, A. O. HAMPTON and GEORGE M. WYATT, Washington, D. C.:

Rectal Bleeding—Polyps and Early Carcinoma of the Colon: The exhibit shows that (1) the discovery of polyps of the colon is dependent on proctoscopy, sigmoidoscopy and roentgen examination; (2) bleeding from the bowel even as a single episode may indicate the presence of a polyp or carcinoma and must be explained; (3) the barium sulfate enema examination necessary to disclose the cause of bleeding from the bowel must be carried out with painstaking thoroughness. The following steps are necessary: (a) fluoroscopy with palpitation and preevacuation roentgenograms, (b) compression spot roentgenograms of suspected area, (c) the addition of tannic acid to the barium sulfate enema (2 per cent by weight in the water), (d) good postevacuation roentgenograms to show mucosal relief of the contracted colon and (e) repetition of an unproductive examination must be done until the origin of bleeding is demonstrated or the normal anatomy of the entire colon is shown. A polyp removed is a cancer prevented.

LOUIS H. JORSTAD and EMMETT B. DRESCHER, St. Louis:

Diagnosis and Treatment of Cancer of the Head and Neck Region: Photographs emphasize the diagnostic features of cancer as it occurs in the head and neck region, with emphasis as to form of treatment and follow-up results. Particular regions emphasized are eyelids, ears, nose, lip, buccal mucosa and tongue.

JAMES BARRETT BROWN, FRANK McDOWELL and MINOT P. FRYER, Washington University School of Medicine, St. Louis:

Neck Dissection for Metastatic Carcinoma: Colored illustrations of the operation for complete neck dissection are shown with explanatory charts.

E. LAWRENCE KEYES and HENRY PINKERTON, St. Louis University, Cancer Control Program, St. Louis:

Three Unusual Tumors of Clinico-Pathologic Interest—A. Lymphangitic Carcinoma of Lung; B. Plasmocytoma of Thyroid; C. Chordoma of Sella Turcica: The exhibit presents the clinical, radiologic and pathologic aspects of 3 recent cases, chosen for their general interest. In addition to the visual presentation, a brief discussion of each tumor will be given and the prognosis and treatment outlined.

J. WILLIAM THOMPSON and E. L. MILOSLAVICH, DePaul Hospital, St. Louis:

Surgical Pathology—Gastrointestinal Tract: The exhibit consists of gross specimens of malignant lesions of the gastro-

intestinal tract, surgically removed, mounted and prepared by an original method using a colored background with indirect illumination.

AMERICAN CANCER SOCIETY, Missouri Division, Jefferson City, Mo.:

Public Education in Cancer—How Your Doctor Detects Cancer: The central theme of the exhibit demonstrates how the practicing physician detects cancer by the employment of the senses of the sight, hearing and touch. One section of the exhibit will emphasize the three methods of treating cancer—with roentgen ray, operation and radium. One panel is devoted to the hope of cure.

BREWSTER S. MILLER, American Cancer Society, Inc., New York:

Professional Education in Cancer: Illustrations depict many of the activities of the professional education section of the American Cancer Society, including the Society's new journal, *Cancer*, illustrated lantern slide library, lending library of professional films, the Society's exhibit program and fellowship program, monographs on the early recognition of cancer of various sites, a new film illustrating the general practitioner's responsibility and opportunities in cancer control, the Society's participation in various medical meetings and the library's function in professional education, as current literature, cancer bibliography and topical bibliographies.

ALBERT KUNTZ, WILLIAM F. ALEXANDER, CALVIN A. RICHINS, NORMAN M. SULKIN and WILLIAM P. HENDERSON, St. Louis University School of Medicine, St. Louis:

Autonomic Nervous System: The exhibit is divided into three parts: (A) The anatomic relationships of the sympathetic trunks and the communicating rami are illustrated by drawings made from dissections of human cadavers and in anatomic preparations. The significance of certain normal anatomic relationships and some common variations in relation to sympathectomy is pointed out. (B) The responses of the smaller blood vessels in the intestine and other viscera to localized warm and cold stimulation of the skin are illustrated as observed in sections prepared by the freeze-dry technic. The cutaneous visceral reflex arcs concerned in these responses are illustrated diagrammatically. (C) The histologic structure of the autonomic ganglia is illustrated in photomicrographs with particular reference to the neuroglial supporting tissue. Individual ganglion cells are illustrated photomicrographically to show the chromidial substance, the Golgi apparatus, the ascorbic acid content, etc.

VERONICA L. CONLEY, Joint Committee on Cosmetics, American Medical Association, Chicago:

Cosmetic Dermatitis: The exhibit presents common causative agents, diagnostic aids, treatment and prognosis in cosmetic dermatitis. Illustrations consist of transparencies and photographs depicting dermatoses acquired from various cosmetics.

CLEVELAND J. WHITE, CHARLES S. GILBERT and FRED R. SCHWARTZ, Stritch School of Medicine of Loyola University, Chicago:

The Positive Wassermann—Its Clinical Interpretation: A positive Wassermann reaction may mean clinical syphilis. It may confirm the diagnosis of suspected syphilis. At least forty-two other diseases, both dermatologic and internal syndromes, may present a positive serologic reaction. Charts, drawings and posters show exactly how such a reaction can be definitely clinically interpreted.

MORRIS MOORE, The Barnard Free Skin and Cancer Hospital, St. Louis:

Mycotic Infections: The exhibit presents a clinical and mycologic classification of the pathogenic fungi of man. Clinical photographs and photomicrographs illustrate both the infections in man, the appearance of the causative fungi in their parasitic state and the pathologic processes that they induce. Charts show the relationships in a schematic arrangement of the various

mycoses. Cultures of the fungi in Petri dishes demonstrate their appearance in a saprophytic state; Kodachromes of some of the cultures and histopathologic sections are shown.

LESTER M. MORRISON, College of Medical Evangelists, Los Angeles County General Hospital, Los Angeles:

Alcohol and the Liver—Effects and Treatment: The results of eight years' investigation of the clinical and pathologic changes in the liver resulting from an abnormal intake of ethyl alcohol are presented. Histologic changes in the liver, as secured by punch biopsy before and after treatment, are shown. The results of treatment by various new lipotropic agents, such as a new choline carbonate, a new liver extract and high protein diet, are shown. The various forms and stages of the liver damaged by alcohol are described, with particular reference to therapy and prognosis.

PAUL N. HARRIS and K. K. CHEN, Lilly Research Laboratories, Eli Lilly and Company, Indianapolis:

Experimental Liver Injury: Photomicrographs illustrate liver injury produced by: (1) *p*-dimethylaminoazobenzene, a carcinogen, (2) a group of fourteen pure alkaloids derived from plants of the genera *Senecio*, *Heliotropium* and *Crotalaria* and (3) a miscellaneous group of agents, including seeds of *Amsinkia horizontalis*, tannic acid, carbon tetrachloride, diethylene glycol and a high cystine diet.

JAMES F. KELLY, D. ARNOLD DOWELL, JOHN E. DOWNING and JAMES F. KELLY JR., Creighton University School of Medicine, Omaha:

Roentgen Rays in Prevention and Treatment of Infections—A Fifty Year Review: Considerable experimental and clinical evidence has accumulated in the past fifty years on the use of roentgen rays in prevention and treatment of infections. The old concept of heavy dosage, such as used in treating malignant conditions, has been universally discarded in favor of lower voltage and lower dose therapy in treating infections. It is now recognized that therapy of inflammations and the therapy of tumors are two entirely different procedures. Observations of many workers who assisted in establishing these facts will be presented. Roentgen rays in infections have definitely passed from the theoretical to the practical stage.

WM. A. KNIGHT JR., R. O. MUETHER and ANNE SOMMER, St. Louis University School of Medicine, St. Louis:

Pancreatitis—Clinical and Diagnostic Studies: A graphic analysis of study of various types of pancreatic disturbance, including the result of the prostigmine diastase test.

R. O. MUETHER, WM. A. KNIGHT JR. and VICENTE MORALES, St. Louis University School of Medicine, St. Louis:

Liver Biopsy—Diagnostic Aid in Liver Disease: Pictorial demonstration of results of liver biopsy in inflammatory metabolic and neoplastic disease of the liver, using Kodachrome slides and charts.

KARL A. MEYER, DONALD D. KOZOLL, WILLIAM S. HOFFMAN, FREDERICK STEIGMANN and HANS POPPER, Hektoen Institute for Medical Research of the Cook County Hospital, Chicago:

Amino Acids in Clinical Medicine: The value of specially processed proteins and of amino acid preparations in the treatment of conditions accompanied with protein deficiencies will be demonstrated, both by the results obtained from clinical observations and those of laboratory studies. The role of specific amino acids in enhancing the biologic value of natural protein and in combating specific deficiencies will be explained. The etiologic and pathogenetic mechanism of protein deficiency in renal, hepatic and various surgical diseases will be discussed, as will the therapeutic indications of amino acids. The exhibit will describe methods for the biologic evaluation of protein preparations in animal and human subjects, and it will deal with the principles involved in the practical application of amino acid therapy.

ST. LOUIS PATHOLOGICAL SOCIETY, St. Louis:

Laboratory Demonstrations: A complete laboratory will be installed for blood sugar, blood urea and many other laboratory examinations, where physicians may have their own blood tested. Blood cell counts and blood staining will be demonstrated, and microscopes will be available to show various blood dyscrasias. Emphasis will be placed on the fact that the laboratory is not a substitute for case history and physical examinations, but rather an aid in differential diagnosis.

EDWARD M. GUNN, JOSEPH E. SMADEL, THEODORE E. WOODWARD, LIEUT. HURBERT L. LEY JR., CORNELIUS B. PHILIP, ROBERT TRAUB and ELIZABETH JACKSON, United States Army, Washington, D. C.:

Therapeutic Evaluation of Chloromycetin: The display features the therapeutic evaluation of chloromycetin on typhus and scrub typhus, depicting the method of treatment and the effect obtained.

JAMES A. WHEELER, Axtell Clinic, Newton, Kan.:

Encephalomyelitis Virus—Comparative Study of Western Equine Virus and St. Louis Virus: A comparative study is presented of western equine virus and St. Louis virus. This exhibit shows the reservoir as found in two separate studies (J. A. Wheeler; R. J. Blattner and J. V. Cooke) and the vector transmission of the two virus diseases. The object of this exhibit is to show the interesting comparison of the findings of two separate studies, in which two different vectors were involved with the transmission of each virus disease from sources found in nature. In western equine virus it was found that 50 per cent of assassin bugs from rats' nests in pastures contained virulent western equine virus, and the present theory is that the young assassin bugs gain their wings in the spring and fly to horses in the pasture. With the proper influx of seasonal mosquitoes the stage was set for an epidemic, which was found in 1941 to involve 50 per cent of the cases of blood samples in which a serum neutralization test was made for western virus.

COL. JOHN R. WOOD, M.C. and STANLEY H. DURLACHER, Medical Division, Army Chemical Center, Maryland:

BAL in Heavy Metal Poisoning: The exhibit shows the effect of BAL in heavy metal poisoning.

HILGER PERRY JENKINS, DAVID S. FOX, RUDOLPH W. JANDA and DOUGLAS PACKARD, University of Illinois College of Medicine and Woodlawn Hospital, Chicago:

Intestinal Intubation: The indications for intubation for relief of intestinal distention are presented by roentgenographic studies of illustrative cases. The mechanical details which are necessary for the successful use of the Miller-Abbott tube are demonstrated with the aid of a manikin. The hazards and limitations of intubation are pointed out. Cases are reviewed in which the Miller-Abbott tube was used to obtain decompression of the distended small intestine due to obstruction or paralytic ileus, thus obviating surgical treatment or permitting operation in more favorable circumstances. Although intestinal intubation is a standard procedure in many of the larger hospitals, there are still many communities where this type of service is not yet available.

LIBRARY, Washington University School of Medicine, St. Louis:

Manuscripts and Letters of William Beaumont, Pioneer American Physiologist: A collection of manuscripts and letters of Dr. William Beaumont, containing his account of the gunshot wound of Alexis St. Martin, which enabled Beaumont to study the processes of digestion, is exhibited. These studies led to the publication of Beaumont's famous book, "Experiments and Observations on the Gastric Juice and the Physiology of Digestion," 1833, and copies of the various editions are shown. Photographs and biographic material about Beaumont, such as notebooks, diaries and case books, are exhibited also.

OLIVER FIELD, Bureau of Investigation, American Medical Association, Chicago:

Mechanical Quackery: The exhibit shows various weird mechanical devices that have been foisted on the public for the cure of human ills. Among other items shown are Radioclast, Goetherator, Perkins' Tractors, Ghadiali Spectro-chrome, Radium or Vrilium Tube, Radiendocrinator, Radium Pad, Geo-Radium and nose adjusters.

A. RAY DAWSON, Veterans Administration, Washington, D. C.:

Physical Medicine and Rehabilitation in Tuberculosis and Thoracic Surgery: The ultimate goal in the rehabilitation of patients with tuberculosis and other diseases of the chest is not only the physical recovery of these persons but their training for future economic independence. The exhibit will include charts, photographs, slides, motion pictures and apparatus showing the various rehabilitation activities. Patients will also be demonstrated.

A. RAY DAWSON, Veterans Administration, Washington, D. C.:

Evaluation of Physical Capacity of Tuberculous Patients: The exhibit deals with the technic which is employed in physical medicine rehabilitation in the Veterans Administration Tuberculosis Hospitals to measure and evaluate the physical capacity of tuberculous patients, to perform the various tasks which are involved in daily living, such as self-care activities—eating, dressing and bathing, recovery and vocational activities.

SEDGWICK MEAD, Washington University School of Medicine, Department of Occupational Therapy, with the assistance of the Association of Occupational Therapists of Missouri, St. Louis:

Occupational Therapy: The exhibit shows photographs illustrating functions of occupational therapy from the physical aspect, psychosocial aspect and prevocational aspect.

HOWARD A. RUSK, GEORGE G. DEEVER and DONALD A. COVALT, New York University College of Medicine, New York:

Rehabilitation in Hemiplegia: The exhibit shows methods and devices for the late rehabilitation of patients with hemiplegia. Patients will be used in the demonstrations.

MILDRED ELSON and BARBARA WHITE, American Physical Therapy Association, New York:

Physical Therapy: The purpose of the exhibit is to acquaint the general practitioner with physical therapy and its use in providing complete care in various types of cases. The exhibit illustrates physical therapy as an essential part of good medical care and physical therapy procedures in the later stages of physical rehabilitation. A variety of cases for which physical therapy is prescribed and many of the different procedures used in physical therapy are shown.

HOWARD A. CARTER, Council on Physical Medicine, Committee on American Health Resorts, American Medical Association, Chicago:

American Health Resorts: The exhibit presents information concerning health resorts in the United States. Charts explain the aims and purposes of the Committee on American Health Resorts.

W. OLIVER KINCANNON, Federal Security Agency, Office of Vocational Rehabilitation, Washington, D. C.:

Vocational Rehabilitation for Civilians: The exhibit includes an outline of the vocational rehabilitation services available to disabled persons through a nationwide federal-state partnership program, with emphasis on the services of physical restoration.

JACOB J. WEINSTEIN, George Washington University School of Medicine and Gallinger Memorial Hospital, Washington, D. C.:

Parenteral Proteins in Surgery: The exhibit shows (1) the indications for parenteral proteins in both surgical and medical

cases; (2) tolerance studies with parenteral protein hydrolysate by intravenous, subcutaneous and intramuscular routes; (3) the physiologic and histologic alterations associated with protein deficiencies; (4) postoperative blood deficiency in various surgical procedures, with particular reference to the nitrogen loss and the particular references of its effect on the blood proteins and hemoglobin; (5) clinical results, showing the effects of protein hydrolysate in various surgical procedures on patients who have received protein therapy; (6) toxicities, describing reactions for the entire study, and (7) program for parenteral feeding with various types of surgical procedures.

ROBERT W. BARTLETT, Washington University School of Medicine, St. Louis:

The Surgical Management of Large Goiters: The exhibit shows photographs of patients before and after operation, the removed specimens and roentgenograms showing the pronounced tracheal distortion that occurs with certain large goiters and drawings detailing the technic of the operation providing the maximum exposure for removal of such growths with safety. Technical points of the operation and the type of anesthesia required are included.

GRAHAM ASHER, LAWRENCE STEFFEN and FRANKLIN D. MURPHY, University of Kansas School of Medicine, Kansas City, Kan.:

Latent or Subclinical Tetany—A Clinical Study of Its Presence in Cardiovascular Diseases: The exhibit shows descriptive charts of clinical features and symptoms, clinical charts of cases of latent tetany, illustrations and photographs of abnormal muscle responses. Descriptive leaflets of the exhibit, with the theoretical considerations, will be available.

LAURENCE F. GREENE, Mayo Clinic, Rochester, Minn.:

Urinary Incontinence in Females Due to Ectopic Ureters: Urinary incontinence occurs in females as a result of ectopic ureters. In this condition the ureter, instead of entering the bladder, opens into the urethra or the vestibule of the vagina and results in a constant uncontrollable escape of urine. This distressing anomaly can be easily recognized and completely cured by proper surgical procedures. The exhibit will include illustrative roentgenograms and a diagrammatic model.

ROBERT DEAN WOOLSEY, St. Louis University School of Medicine, St. Louis:

Thoracolumbar Sympathectomy for Essential Hypertension: Drawings show the operative procedure, and charts present the results of the operation.

FRED Z. HAVENS, Mayo Clinic, Rochester, Minn.:

Hypospadias—Surgical Correction: The exhibit shows by models, photographs and drawings (1) the various types and degrees of hypospadias and (2) the technic of the surgical treatment of this deformity by (a) the use of Edmund's operation for correction of the chordee and (b) the use of the inlying tubular graft for reconstruction of the missing portion of the urethra. A statistical analysis of the results in 80 cases in which operation was performed in the last five years will be presented.

WILLIAM J. ATKINSON JR., St. Louis University Medical School and St. Louis University Medical Service, St. Louis City Hospital, St. Louis:

Tetraethylammonium Chloride in the Treatment of Angina Pectoris: The exhibit presents charts and diagrams summarizing results obtained in treating 27 patients with angina pectoris with tetraethylammonium chloride. Twenty-four of these showed symptomatic improvement. Seventeen of the patients were treated for long periods (varying from six to fifteen months) with no harmful effects. Especially gratifying results are noted in long-continuing pain associated with coronary insufficiency and not relieved by glyceryl trinitrate. Judging correct dosage individually in each case is emphasized. An outline of the known cardiovascular pharmacologic aspects and other possible mechanisms of action is presented.

ALBERT E. GOLDSTEIN, Sinai Hospital and University of Maryland School of Medicine, Baltimore:

Studies in Polycystic Renal Disease: A comparative study was made of operative and nonoperative cases of polycystic renal degeneration. It is shown that in cases of polycystic kidney which are operated on there is a longer duration of life with complete relief of symptoms. The author's procedure is prescribed.

W. F. MELICK, D. G. GNOSE and J. F. MACKEY, St. Louis University School of Medicine, St. Louis:

Experimental Uses of Translumbar Aortography: The exhibit shows has relief photographic copies of aortograms done pre-operatively and postoperatively on hypertensive patients. Perirenal air studies and aortograms on case of hypertension due to adrenal adenoma are presented with case histories.

HUGH A. SCHROEDER, D. F. DAVIES, M. L. GOLDMAN, J. A. NUTZEL, N. S. OLSEN and A. H. WILLIAMS, Washington University School of Medicine, St. Louis:

Pathogenesis of Arterial Hypertension: The pathogenesis of arterial hypertension is indicated by the interaction of the various factors involved. These are the psychogenic, the neurogenic, the renal, the humoral and the effects of hypertension on blood vessels. Experimental work dealing with these factors will be shown. The effect of special diets and other measures in raising or lowering blood pressure will be demonstrated.

WILLARD BARTLETT JR., St. Louis University School of Medicine, St. Louis:

Clinical Research in Abdominal Surgery: The exhibit presents (1) text and charts setting forth the clinical course of a patient with severe streptococcal peritonitis, plus (a) the components of intake and output and pertinent data of his blood chemistry during a ten day period of parenteral feeding, (b) comment on the principles governing parenteral nutrition and maintenance of hemodynamics and (c) how the pitfalls of dehydration and edema may be avoided; (2) the quantitative estimate of gastrointestinal derangement in ileus of whatever origin and the characteristic differences in volumes recovered by nasal catheter suction in (a) mechanical obstruction, (b) peritonitis and (c) with protein depletion alone, and (3) the anatomic and physiologic reasons for weight reduction prior to the operative repair of large incisional hernia, outline of points of technic and preoperative and postoperative photographs.

GORDON M. SCHOEFFLE, Washington University School of Medicine, St. Louis:

A Student Experiment in Nerve Physiology: The exhibit shows a nerve chamber with adjustable silver electrodes, amplifier and cathode ray oscilloscope with appropriate synchronizing circuits to record single impulses in response to short shock electrical stimulation. Movable jack plugs allow the observer to vary conduction distance of the impulse and to adjust the interval between two shocks and thus determine excitability curves. Dials are "fool proof" in that neither machinery nor observer will suffer harm. This is the device actually employed by the students in the laboratory.

GARRETT PIPKIN and H. H. VIRDEN, St. Joseph Hospital, Kansas City, Mo.:

Indefinite Knee Symptoms Resembling Injured Cartilages: The exhibit illustrates the variations in anatomy of the suprapatellar pouch caused by the communication of the suprapatellar pouch with the knee joint. It is normal for a suprapatellar plica (fold) to occur in the synovia. This fold may become fibrosed, hyalinized or calcified and cause symptoms simulating closely a disturbance of the semilunar cartilage.

ANTHONY M. BARONE, Chicago:

Varicose Veins and Venous Thrombosis of the Lower Extremity: The exhibit includes the etiology, diagnosis, complications, sequela, differentiation of ulcers, various tests and

treatments and an analysis of 1,000 cases of varicose veins. The differentiation, diagnosis and various treatments of venous thrombosis are given, including case reports.

WILLIAM MILTON ADAMS, Memphis, Tenn.:

Free Composite Grafts of the Nipples in Mammary Plasty: The exhibit shows pictures of cases before and after operation, as well as pictures and drawings illustrating the operation.

MERL CARSON and DOROTHY RINDERER, Washington University School of Medicine, St. Louis:

Postgraduate Medical Studies: The exhibit portrays the postgraduate activities of the Washington University School of Medicine. It consists mainly of posters, charts and photographs depicting various types of activities in the postgraduate school. The various types of classes that are offered during the year are represented so that the practitioner will have a definite idea as to the courses of study available.

A. C. STUTSMAN, Washington University School of Medicine, St. Louis:

Foreign Bodies of the Tracheal Bronchial Tree and Esophagus: The exhibit of roentgenograms shows the various changes produced by nonopaque bodies in the tracheal bronchial tree. Foreign bodies of the upper portion of the esophagus are presented.

GUERDAN HARDY, Washington University School of Medicine and St. Louis County Hospital, St. Louis:

Fractures of the Zygomatic (Malar) Bone—Diagnosis and Treatment: The exhibit includes charts showing causes of malar fractures, the diagnosis and associated injuries; photographs and roentgenograms of patients, and drawings showing proper approaches in both simple depression and comminuted fractures.

WILLIAM B. KOUNTZ, ESDEN KIRK, PHILLIP ACKERMAN, LILLI HOFSTETTER and MARGARET CHIEFFI, Washington University School of Medicine and St. Louis City Infirmary Hospital, St. Louis:

Changes in Man Associated with Age: The exhibit shows an evaluation from a physiologic and anatomic point of view of changes associated with age in man. Studies are presented which indicate that there is considerable variance in the functions of the young contrasted with the old. Attempts at modification of some of the functions are made by the administration of hormones, food substances and vitamins.

JAMES F. DOWD, St. Louis University School of Medicine, St. Louis:

Technic of Rhinoplasty: The exhibit presents the basic rhinoplastic technic as used by the author. A series of drawings depict the essential steps as they are done in the average case. Four sets of preoperative and postoperative photographs will be used to show the results obtained on four common types of nasal deformities. These will include the large dorsal hump, the large bulbous tip, the saddle nose and the traumatic deformity in which the nose is displaced beyond midline.

MOTION PICTURES

Motion pictures will be shown in the clinical presentation rooms adjoining the Scientific Exhibit. The following films will be shown daily from 12:15 to 3:15 p. m.:

UNITED STATES NAVY, Bureau of Medicine and Surgery, Washington, D. C.:

Clinical Malaria: The relationship of the life cycle of the malarial parasite in the blood stream to the patient's clinical symptoms is clearly shown by actual photography and animation. Three common types of infection (benign tertian, quartan and malignant tertian) are discussed. Sound, thirty minutes.

HARRISON L. McLAUGHLIN, New York:

An Introduction to Fractures: An introduction to the subject of fractures in a general way. Sound, thirty minutes.

J. HORVATH, University of Erlangen, Erlangen:

Ultra Sound in Medicine: This film represents pioneer work in exploring the possibilities of ultra sound in medicine. Methods for generating vibrations too fast for hearing are shown, revealing the curious physical effects of such vibrations, particularly on liquids and certain biologic effects followed by the technical problems to be solved before therapeutic applications are mentioned, including preliminary results with microscopic findings. Silent, twenty-five minutes.

MILTON MCCALL and ARTHUR FIRST, Jefferson Medical College, Philadelphia:

Cesarean Section—Norton Paravesical Extraperitoneal Technic: A motion picture depicting the paravesical technic of Norton. This type of extraperitoneal cesarean section has proved safe even in cases of the most profound infection. The use of the technic obviates the sacrifice of the uterus by cesarean hysterectomy and makes difficult embryotomy unnecessary. An actually infected patient was used in making this film. Silent, fifteen minutes.

LESTER R. DRAGSTEDT, University of Chicago, Chicago:

Supradiaphragmatic Gastric Vagotomy for Peptic Ulcer—The Abdominal Approach: Technic of gastric vagotomy by the abdominal approach with illustrations of the anatomy of the vagus nerve. Silent, twenty minutes.

DONALD F. HILL, W. PAUL HOLBROOK, CHARLES A. L. STEPHENS JR., LEO J. KENT and EDNA MCCARTHY, Tucson, Ariz.:

Rheumatoid Arthritis: The method of preventing deformities and correcting deformities in rheumatoid arthritis, including end results in a number of patients, is depicted in this film. Silent, seventeen minutes.

LOUIS E. MOON and J. B. CHRISTENSEN, Creighton University School of Medicine, Omaha, Neb.:

An Improved Technic for the Operative Treatment of Anorectal Lesions: Simple, practical and successful methods of making proctologic examination are presented and operative procedures for the treatment of common anorectal lesions demonstrated. A routine proctologic examination is shown, with animated anatomic illustrations reviewing the anatomy of the region followed by closeup shots of the examination in actual cases. A simple ligature type of operation for removal of internal and external hemorrhoids is shown, as well as operations for anal fissure, abscess and a simple fistula. Silent, forty-four minutes.

UNIVERSITY OF ILLINOIS, Division of Services for Crippled Children; Chicago:

Nursing Care in Poliomyelitis: This motion picture forms a coherent sequence demonstrating the technics used in all stages of poliomyelitis: (a) the acute stage, (b) the stage of spastic muscular activity and pain, (c) the stage of respiratory difficulty in bulbar cases, with details of procedure and patients in the respirator, and (d) the convalescent stage, with details of muscle training and underwater exercises. Sound, sixty-eight minutes.

BRITISH INFORMATION SERVICES:

Polio Diagnosis and Management: In this film, patients are shown illustrating: (1) differential diagnosis of the early stage of poliomyelitis, (2) the probable existence of many undiagnosed atypical forms of the disease, (3) the importance of correcting little unsanitary working habits among housewives, (4) the multiplicity of effects on the nervous system and (5) the necessity of cooperation among various individuals and agencies for restoring the patient to the best possible degree of productivity. Sound, fifty-seven minutes.

The Technical Exposition

INTERIM SESSION

St. Louis, Mo., November 30—December 3, 1948

The primary aim of the Technical Exposition at the Interim Sessions is to show the General Practitioner the most recent developments which industry has produced for the modern practice of medicine.

In addition to broadening your knowledge and technic, the St. Louis Exhibition offers many *new* helps: up to date equipment with numerous applications; first-hand information on testing procedures which you can perform in your own office; the Papanicolaou method of cancer diagnosis; blood sugar screening test, etc. You can learn more about the newer discoveries—antibiotics, amino acid preparations, anti-histaminics, hematinics, hormones, triple-sulfa drugs. Along with the new will also be found the standard and long established products . . . outstanding books of the leading medical publishers . . . modern hearing aids . . . nutritional products . . . infant specialties. Among other interesting and informative features will be televised surgical and clinical methods.

At each booth will be trained men, or women, ready to give useful information and help in solving your workaday problems. They cordially invite you (and so do we) to visit the exhibits whenever possible—before meetings, between meetings, and afterward—to get a clearer picture of current progress in practically every field of medicine. The Municipal Auditorium will be open daily from 8:30 A. M. to 6:00 P. M. beginning Tuesday, November 30 and closing 12:00 noon, Friday, December 3. Brief descriptions of some of the exhibits on this and the following pages will give you further information about what may be seen.

THOS. R. GARDINER, Business Manager and Director
of Technical Exhibits.

ABBOTT LABORATORIES

Booth D-4

Desoxyn Hydrochloride, an effective cerebral stimulant with a wide variety of uses, and Pentothal Sodium, an intravenous anesthetic, will be the featured products exhibit. Abbott comes an opportunity of Desoxyn and the worldwide clinical background of Pentothal Sodium.

A. S. ALOE COMPANY

Booths D-20, D-22

On display here will be a cross section of the complete line of hospital, surgical, and laboratory equipment and supplies carried by the "world's largest surgical supply house" including a large number of specials from their war surplus and regular stocks. By all means, do not miss these money-saving values. If you would like to visit their home office and sales room—only a few blocks from the Auditorium—contact any of their representatives who will be happy to arrange a tour of their home office for you.

AMERICAN HOSPITAL SUPPLY CORP.

Booth A-13

Highlighting the American Hospital Supply exhibit will be Baxter Intravenous Solutions, Blood Transfusion and plasma equipment plus new Baxter disposable accessories for the administration thereof, Blood grouping Serums, and certain selected Tomac specialty products.

AMES COMPANY, INC.

Booth D-15

Ames Company representatives will be glad to discuss Decholin, the standard hydrocholeretic agent for the treatment of biliary tract diseases, and Decholin Sodium, pure sodium dehydrocholate. They will be demonstrating Clintest and Hematest—simplified tests for the detection of urine-sugar and occult blood.

ARMOUR & COMPANY

Booth B-5

Armour Toiletries, a division of Armour and Company, is proud to exhibit at the Second Annual Interim Session of the American Medical Association its Stork Baby Products. These products, accepted for advertising in publications of the American Medical Association, include the famous Stork Castile Soap, a leader in baby's complexion care for 40 years, and the scientifically-safe companion products, Stork Baby Oil and Stork Baby Powder. Conventioneers are invited to see the Stork exhibit in Booth B-5.

THE GORDON ARMSTRONG CO., INC.

Booth C-16

Save a little time to inspect the Armstrong X-4 Baby Incubator. Recently this full length view modern Incubator was awarded the acceptance of the Council on Physical Medicine of the American Medical Association. Added to this, the Armstrong X-4 Baby Incubator has enjoyed for several years, the approval of Underwriters' Lab-

oratories and the Canadian Standards Association. The exhibit will not be for sales, but rather to answer questions and give service on the six thousand Armstrong X-1 Baby Incubators now in use all over the world.

ASSOCIATED MEDICAL CARE PLANS

Booth A-25

Fifty-five Blue Shield Plans are represented in this exhibit. Complete information from experienced personnel will be available at the booth.

Current reports on Blue Shield progress and national activities will be of special interest to those who wish to check on the advancement of medically sponsored nonprofit prepayment plans.

AYERST, McKENNA & HARRISON, LTD.

Booth B-16

Some valuable information on "Premarin" soluble tablets . . . orally-active, conjugated estrogens (equine) may be had here. The potency of "Premarin" is expressed in terms of its principal estrogen, sodium estrone sulfate; and "Premarin" is available in tablets of four potencies and also in liquid form.

BECK-LEE CORPORATION

Booth B-1

Be sure to visit the Beck-Lee exhibit and see the new development in Electrocardiography—an electrocardiograph with an automatic developing camera which completely develops moving photographic paper or film! The entire process including developing, fixing, washing, drying takes place within the camera. The minute electrical currents of the human heart are picked up by the electrocardiograph and recorded on moving photographic paper within the camera. A continuous photographic record of the heart current rolls from the camera until the cardiogram is completed.

MARJORIE BELL CO.

(between D-9 and D-15)

CREME-LACQUER a fascinating hair-dressing by Marjorie Bell that is non-stiffening, non-alcoholic, non-flaking and non-oily after applying to your hair, will attract your attention here! To a patient, the psychological value of boosting morale by having his or her hair nicely groomed with shining, youthful highlights, is immeasurable. To the well person in professional life it gives assured confidence in presenting a well-kept appearance. Be sure to stop by and become acquainted with this unique preparation.

Booth B-7

THE BLAKISTON CO.

Booth D-8

BURNS CURTIS CO.

Booth B-24

BURROUGHS WELLCOME & CO.
(U.S.A.) INC.

Booth D-2

BURTON MANUFACTURING COMPANY

Booth D-10 (a 1/4)

CAMEL CIGARETTES

Booth D-13

CAMERON SURGICAL SPECIALTY COMPANY

Booth C-7

CARNATION COMPANY

Booth D-21

CENTRAL PHARMACAL COMPANY

Booth D-17

CIBA PHARM. PRODUCTS

Booths C-22, C-24

COOPERATIVE MEDICAL ADVERTISING
BUREAU

Booth A-10

C.S.C. PHARMACEUTICALS

Booth D-29

CUTTER LABORATORIES

Booth B-19

DEVEREUX SCHOOLS

Booth D-14

F & J MANUFACTURING CO.

Booth B-28

EDIN ELECTRONICS CO.

Booth B-26

ELECTRONIC SURG. EQUIP. CO., INC.

Booth B-31

ENCYCLOPAEDIA BRITANNICA

Booth C-30 (w 1/2)

FANCEE FREE MFG. CO.

Booth C-18

H. G. FISCHER & CO.

Booth B-36

GERBER PRODUCTS CO.

Booth A-29

GRADWOHL LABORATORIES

Booth C-26

GRUNE & STRATTON, INC.

Booth A-16

Outstanding among the recent publications of GRUNE AND STRATTON are H. A. Davis' SHOCK AND ALLIED FORMS OF FAILURE OF THE CIRCULATION; Kurt GUAG der's

all fields of medical and surgical practice will be available. In addition to American publications, leading British periodicals issued by the B. M. A. will be shown.

HAMILTON-SCHMIDT SURGICAL CO.

Booth D-27

... of Burdick ... a new radar ... and other surgical equipment will spotlight the Hamilton-Schmidt exhibit. Information on the operation of these units will be given to visiting physicians.

HANOVIA CHEMICAL & MFG. CO.

Booth B-12

Some interesting information about an entirely new Wall Type Aero-Kromayer Lamp at a new low price will be heard by visitors here. Representatives will be at your service to present you with all the facts. General body type ultraviolet lamps, Solux Radiant Heat lamps, and Safe-T-Air Models for the destruction of air-borne bacteria will be demonstrated.

THE HARROWER LABORATORY

Booth D-9

The Harrower exhibit will present gastroscopic and acidity control studies relative to Mucotin, a mucin antacid mixture. The exhibit will have three main points of interest: gastric acidity control studies; a case history report of a patient with a gastric ulcer (the ulcer and its response to treatment are illustrated gastroscopically); and gastroscopic pictures showing the coating action of Mucotin.

PAUL B. HOEBER, INC.

Booth A-30

PAUL B. HOEBER, INC., Medical Book Department of Harper & Brothers, Booth A-30, invites you to inspect the entire list of HOEBER publications including these new volumes for the family physician: the new fourth edition of Alvarez' *Introduction to Gastro-Enterology*, Barrow's *Clinical Management of Varicose Veins*, Mengert's *Diagnoses, and Schwedel's of the Heart*. Late journals, *Cancer* and *Psychosomatic Medicine* will also be available. Be sure to visit the Hoerber booth.

HOLLAND-RANTOS CO., INC.

Booth B-18

KOROMEX JELLY and KOROMEX CREAM will be featured at booth B-18. You may recall it was the Holland-Rantos Company, Inc., that pioneered the introduction of modern contraceptive technique—so frequently referred to as the Koromex Method. The clinical use of ... back to 1925. ... tives will be interested physicians the latest data on KOROMEX JELLY and CREAM.

W. S. HORN COMPANY

Booth C-21 (a 1/2)

The Hospital Bedlight Bedpan Commode, a portable device for patients occupying hospital beds, will be on display here. A standard bedpan is used as the vessel and the seat is on a level with the top of the bed. This commode offers to many medical, obstetrical, and surgical patients the comfort and convenience of the natural sitting position with a minimum of effort.

HYGEIA, THE HEALTH MAGAZINE

Booths A-4, A-6

In the HYGEIA booth, you will find a pictorial representation of editorial contributors, the processes of editing, the methods used for screening and approving advertising and the various types of readers who benefit from this health magazine. Also presented is a series of sequence lighted color transparencies showing how HYGEIA'S health information is used by professional, educational, and family groups.

INTERCHEMICAL CORP.

Booth A-38

The Biochemical Division of Interchemical Corporation will display two dosage forms of ... —ELAM ... ELAMIN ... These ... signed for intr. ... e adequate amounts of amino acids for the treatment of hypoproteinemia. They are exceptionally well tolerated. Representatives will be present to discuss amino-acid therapy.

IODINE EDUCATIONAL BUREAU, INC.

Booth A-22

This exhibit will emphasize the place of iodine and its compounds and preparations in the fields of surgery, medicine, and nutrition. Samples of official U. S. P. and N. F. preparations containing iodine and samples of iodine preparations accepted by the Council on Pharmacy and Chemistry of the American Medical Association will be displayed. Representatives of the Bureau will be on hand to offer to those in attendance the Bureau's bibliographic and other services in connection with iodine.

JONES METABOLISM EQUIP. CO.

Booth A-17

All physicians concerned in any way with metabolism work, whether running own tests or referring cases elsewhere, will be interested in inspecting the New Jones SUPER MOTOR BASAL metabolism unit. The additional exclusive features of this scientifically advanced unit enable the technician to obtain fully satisfactory tests on the most extreme cases, in spite of irregularity of breathing or lack of patient cooperation.

JORDAN PUMP COMPANY

Booth B-14

The center of interest at the Jordan exhibit will be a 3½ pound motor driven pump for penicillin Mist, replacing the need of heavy oxygen equipment. A pressure and vacuum pump unit, equipped with a special flutter valve to positively control negative pressure within the head will also be of interest.

LANTEEN MEDICAL LABORATORIES, INC.

Booth A-40

LANTEEN MEDICAL LABORATORIES, INC., cordially invite you to visit their exhibit, Booth A-40. Featured will be their well-known Lanteen Flat Spring Diaphragm. Representatives will be pleased to discuss an improved diaphragm fitting technique.

LEA & FEBIGER

Booth A-28

Lea & Febiger invite you to stop at Booth A-28 and examine their selection of new books and new editions, books on Pathology, Gray—Anatomy of the Human Body; Krause—Therapy of the Neuroses and Psychoses; Quiring—Collateral Circulation; Burch and Winsor—Primer of Electrocardiography; Burch and Reuser—Primer of Cardiology; Ormsby and Montgomery—Diseases of the Skin; Joslin—Diabetic Manual; Frohman—Brief Psychotherapy; Herbut—Surgical Pathology and many other books of practical help and guidance.

LEDERLE LABORATORIES DIVISION (AMERICAN CYANAMID COMPANY)

Booth C-1

Lederle Laboratories are proud to have the privilege of exhibiting their recently developed preparations at the Interim Session. Included will be preventive and therapeutic preparations proven to be helpful in the practice of medicine and surgery and accepted as definite advances in the physician's armamentarium.

ELI LILLY AND COMPANY

Booths B-11, B-13

Featured at the Lilly exhibit will be new therapeutic developments and a demonstration of the Blood Sugar Screening Test (Wilkerson-Hefmann Method). This new test takes only five minutes to perform, is accurate within 5 mg. per cent of true glucose value and requires but 0.1 cc. of blood. No preparation, standardization, pipetting, titration, or distilled water is necessary. Your Lilly medical service representative cordially invites you to visit the Lilly exhibit located in booths B-11 and B-13.

J. B. LIPPINCOTT COMPANY

Booth A-31

J. B. Lippincott Company presents an interesting and active exhibit of professional publishing. With the "pulse of practice" centering in an advisory editorial board of active clinicians who constantly review the field, current and coming trends in medicine and surgery are known continually. On the studied recommendations of these medical leaders, Lippincott Selected Professional Books are undertaken.

LUZIER'S, INC.

Booth B-2

A complete display of Luzier's Fine Cosmetics and Perfumes will be exhibited in Booth B-2. This will be of interest to dermatologists and allergists as well as to the ladies who visit the Convention. Officials of Luzier's, Inc., will be on hand to explain Luzier's Service in the field of allergy.

M & R DIETETIC LABORATORIES, INC.

Booth C-6

Similac, a food for infants, derived either partially or entirely of breast milk, will be the center of interest at the M & R Dietetic exhibit. Representatives will appreciate the opportunity to discuss the merit and suggested application for both the normal and special feeding cases.

THE S. E. MASSENGILL COMPANY

Booth D-25

The various Council-Accepted Massengill pharmaceuticals will be displayed at the Interim Meeting. Among these is Methadone, the new synthetic analgesic which roughly parallels the action of morphine. Company representatives will be on hand to discuss various Massengill preparations and to arrange for periodic visits by Massengill sales representatives to physicians not being called on regularly.

F. MATTERN MANUFACTURING CO.

Booth C-10

At the Mattern booth visitors may see the new MFX 200 Unit with push-button ... n. In addition, ... r Mattern units be available.

MEAD JOHNSON & COMPANY

Booth C-5

Amigen and Protolysate will highlight the Mead Johnson Interim display. Mead Johnson has pioneered the amino acid field commercially; the products have been described in more than four hundred articles in the medical literature. Trained representatives will be at the Mead exhibit to discuss details of the new amino acid products. Shown also will be Dextrin-Maltose, Pabulum, Pabena, Oleum Percormorphum, and the other Mead products used in Infant Nutrition. Protolysate, a new high-protein product will be displayed, also Lomolac for low-sodium diets.

THE MEDICAL BUREAU

Booth A-1

Burnelle Larson offers the facilities of The Medical Bureau, an organization serving as counselor in problems of medical personnel to medical schools and universities, public health organizations, hospitals and institutions, group clinics, physicians in private practice and industry. The records of Diplomates of the American Boards, younger physicians interested in obtaining training and, also, of administrators, executive and supervising nurses, scientists, laboratory technicians, x-ray technicians, social workers and dietitians are available to those interested in the completion or re-organization of their staffs.

THE MEDICAL PROTECTIVE CO.

Booth B-15

The Medical Protective Company's representative ... a professional ... ites you to visit ... familiar with the principles of the reciprocal rights and duties of a doctor and patient and with the circumstances peculiar to that relationship. He will be glad to explain how his Company meets the exacting requirements of adequate liability protection, which are peculiar to the Professional Liability field.

THE MENNEN COMPANY

Booth B-17

The Mennen exhibit will include: Mennen Baby Oil, Baby Powder, Mennen Castile Baby Soap, Tins-for-Tots (colton tipped applicators) and Baby Cream.

MERCK & CO., INC.

Booth D-12

The Merck exhibit will be devoted to the important subject of streptomycin with emphasis on its role in the treatment of tuberculosis. X-rays taken before and after the use of streptomycin in patients with the following types of tuberculous lesions are on display: Patient A—Advanced caseous tuberculous in a diabetic;

Patent B—Advanced pulmonary tuberculosis and tuberculous pyopneumothorax; Patent C—Advanced pulmonary and laryngeal tuberculosis; Patent D—Acute millary pulmonary and ulcerative oropharyngeal tuberculosis.

THE WM. S. MERRELL COMPANY

Booth A-24

Featured here will be *Diathane Ointment* with *Oxyquinoline Benzate*, an improved preparation for applying an anesthetic to areas that require prolonged contact and where it is desirable to provide a protective antiseptic coating. Of relatively low toxicity, *Diathane Ointment* with *Oxyquinoline Benzate* has established a reputation for safety in clinical use.

MINE SAFETY APPLIANCES CO.

Booth D-31

The MSA Exhibit will feature the Pneumophore, the wartime development of the Aero Medical Laboratories at Wright Field. It will include photographs of the Pneumophore in clinical use as an emergency respiratory aid in Polymyositis and a therapeutic adjunct in the treatment of Anthrax-skin lesions. The treatment of Anthrax-skin lesions is a comparatively late development which has grown out of clinical work at the Barton Memorial Hospital, Philadelphia, and White Haven Hospital, White Haven, Pennsylvania.

THE C. V. MOSBY CO.

Booth A-15

Visitors attending the Interim Session are cordially invited to visit the MOSBY booth, A-15, just inside the exhibit hall. Courteous attendants will be in charge to serve the doctors on their book needs. Among the new titles to be displayed will be Anderson, "Pathology"; Igenfritz, "Pre-operative and Postoperative Care"; Egel, "Treatment of Cerebral Palsy Child"; Kramer, "Clinical Orthoptics"; Dunbar, "Psychosomatic Diagnosis and Treatment"; Black-Vaughan, "Practice of Allergy"; Kleiner, "Human Biochemistry"; and more than twenty other new books and new editions.

G. H. PACKWOOD MFG. CO.

C-21 (5½)

The Packwood exhibit will feature improved *Paxlanosav Heavy Duty Granulated Skin Cleanser* into which greater amounts of *Paxlanosav Emollient* have been integrated. *Paxlanosav Emollient* combines generous quantities of lanolin plus other fine skin normalizers that make it more effective than lanolin alone because more remains during the wash to help protect the natural acid mantle of the skin. In addition to the recognized remarkable cleansing ability of *Paxlanosav Heavy Duty*, other improvements have been made to keep it free-flowing in any powdered soap dispenser, to increase the lather, and to make it more economical to use.

PARAVOX, INC.

Booth C-17

A brilliantly lighted neon display will greet visitors at the Paravox booth. The various production stages of the Paravox Hearing Aids are graphically mounted against a black mirrored surface with gold lettering. Each part is made from an unusual iridescently luminous orange plastic and is extremely effective. This use of plastic in the production of their product recently won the first and only award in the Communications Class of the Modern Plastic's seventh annual competition.

PARKE, DAVIS & COMPANY

Booth D-1

Members of the service staff of Parke, Davis & Company will be at the exhibit for relating to registered pharmacists classified in their pharmaceutical, biologic, and medicinal lists. Unusual Specialties—Benadryl, Theophylline, Mapharsin, D- and various Biologics in the exhibit. You are cordially invited to call at the P-D booth with the assurance your interest will indeed be very much appreciated.

THE E. L. PATCH CO.

Booths B-32, B-34

Their two most recently Council-accepted products—*ALZINOX* and *GLYTHEONATE*—will merit your attention at this exhibit. *Alzinox* is the Patch brand of Dihydroxy Aluminum Aminoacetate, combining the amino acid, glycine, with aluminum. This

combination is of particular value in hyperacidity and peptic ulcer because it provides both rapid and prolonged action without acid rebound. *Glytheonate Tablets* and *Suppositories* provide *Theophylline Sodium Glycinate* permitting high dosage levels of *Theophylline* with minimum gastric irritation. Patch representatives will be glad to welcome you and tell you about these new products, and also about your old friend, *KONDREMUL*.

PET MILK CO.

Booth B-25

An actual working model of a milk condensing plant in miniature will be exhibited by the Pet Milk Company in booth B-25. This exhibit offers an opportunity to obtain information about the production of Pet Milk, its use in infant feeding, and the time-saving Pet Milk services available to physicians. Miniature Pet Milk cans will be given to the physicians who visit the Pet Milk booth.

PETRA MANUFACTURING COMPANY

Booth C-28 (n ½)

Booth C-28 deserves the attention of every convention visitor interested in professional garments for the doctor, nurse, or patient. These protective plastic garments—aprons and other articles—are precision designed and manufactured to give protection against acids, liquids, dust, dirt, chemicals. They are easily kept clean; a whisk of a damp cloth will wipe off any accumulations on the material.

PHILIP MORRIS & CO.

Booths A-2, A-3

Philip Morris & Company will demonstrate the method by which it was found that Philip Morris Cigarettes, in which diethylene glycol is used as the hygroscopic agent, are less irritating than other cigarettes. Their representative will be happy to discuss researches on this subject and problems on the physiological effects of smoking.

W. P. PRIOR COMPANY

Booth C-4

Of special interest at the Prior exhibit is a new volume of *Tice's Medicine on Gastrointestinal Diseases*. This year several hundred new pages were furnished to owners of these sets, including an entirely new volume for *Tice's Medicine on Gastrointestinal Diseases*.

PROFESSIONAL BUDGET PLAN

Booth C-8

Efficient office organization, effective control of accounts, and ethical practice-building ideas will be featured at the exhibit of the Professional Budget Plan. Collection of cash and time payments (old accounts, too), a smoothly functioning appointment system, and simplified bookkeeping are but three of the major points covered. See the special counselor at the booth to learn how this modern business system fits your practice.

THE PYRAMID RUBBER CO.

Booth B-23

Evenflo "America's Most Popular" All-in-One Nurser will be displayed in four and eight ounce sizes, both individually and in attractive Layette Packages. Equipment and illustrations will demonstrate how Evenflo "Breathes as it Feeds." Also, be sure to see the new Evenflo Brushless Baby Bottle Cleanser which dissolves milk film like magic.

RALSTON PURINA CO.

Booths C-23, D-19

The Ralston Purina Company presents a beautiful new booth. Colorful translights graphically illustrate nutrition facts about their two whole wheat hot cereals—Instant Ralston and Hot Ralston—and show dietary uses for Ry-Krisp and Shredded Ralston. You can register for their excellent low calorie diet booklets, for five valuable allergy diets, and for a set of Feeding Direction forms for infants and young children. These are valuable time-saving services for the busy physician.

REXALL DRUG COMPANY

Booth C-11

At the Rexall exhibit you will be interested in learning all about the *Petechiometer*, pronounced *PEE-TEE-KEY-AH-MET-ER*—a new clinical device used in the measurement of increased capillary fragility and for the estimation of the

therapeutic effect of drugs used in the treatment of increased capillary wall weakness. Increased capillary fragility is a syndrome complicating many illnesses.

SANBORN COMPANY

Booth D-11

On exhibit in Booth D-11 will be three completely new developments in instruments for cardiac diagnosis and research: the *Sanborn Electromanometer*, for direct recording of blood pressures (venous and arterial), intra-cardiac and spinal pressures, etc.; the "Poly-Viso," a two-to-four channel recorder for electrocardiograms, blood pressure, sphygmogram, electrokymogram, ballistocardiogram and other phenomena; and the *Sanborn Electrokytograph*. Also on display will be the popular *Sanborn Instruments* for clinical use: the *Viso-Cardiette*, the *Instomatic Cardiette*, and the new *Sanborn Metabolism Tester—The Metabulator*.

SANDOZ PHARMACEUTICALS

Booth A-20

Physicians interested in migraine should visit the Sandoz exhibit, featuring an animated presentation of the current theory of the mechanism of migraine headache and relief following administration of *Gynergen* (ergotamine tartrate). Other preparations displayed include *Digilandin* (crystalline glycosides of *Digitalis lanata*), *Sandozoptal*, *Sellarion* and *Calglucon* (the original calcium gluconate).

W. B. SAUNDERS COMPANY

Booth A-21

This Company extends a cordial invitation to visit their exhibit where they will show their complete line of medical books including Hyman's "Integrated Practice of Medicine," "Gastro-entology," Thorner's "Psychiatry in General Practice," Kinsey's "Sexual Behavior in the Human Male," Beckman's "Treatment," 1948 Collected Papers of the Mayo Clinic, Meleney's "Surgical Infections," Lyons & Woodhall's "Atlas of Peripheral Nerve Injuries," Crile's "Thyroid Disease," Snyder's "Obstetric Analgesia and the Child," DeGowin, Hardin & Alsever's "Blood Transfusion," Dowling's "Acute Bacterial Diseases," A.M.A. Intern's Manual, Brans' "Treatment of Heart Disease," Cecil's "Practice of Medicine," and many others.

SCHERING CORPORATION

Booth A-12

Schering Corporation, the world's largest manufacturer of hormones, will feature *Estring* (ethinyl estradiol) the most potent oral estrogen in clinical use today. *Neotopax* a safe urographic radiopaque medium, and *Protodax*, a standard cholecystographic medium, will also be displayed. Members of the medical and professional service staffs of Schering will be present to welcome inquiries on these important Council-accepted preparations.

SEARER RUBBER COMPANY

Booth B-29

The manufacturer of the "STEADIFEEED" unique aspects of this Unit. A trial of a feeding prove to be a nighting problems you have encountered. Stop by for professional samples and additional details. Your visit is anticipated.

G. D. SEARLE & CO.

Booths A-9, A-11

At the Searle booths a large number of anatomic and pathologic subjects will be exhibited in colored translights, colored slides and plastic models. They will illustrate such conditions as congestive heart failure, bronchial asthma, hay fever, colitis, amebiasis, active rheumatoid arthritis, etc. Featured Products of Searle Research will be *Aminophyllin*, *Metamucil*, *Diodoquin*, and *Gold Sodium Thiosulfate*.

SHAMPAINE COMPANY

Booth C-12

The Shampaine Company plans to exhibit its completely head-end controlled Perfection Major Operating Table, the improved Garfield Protoscopic Table, the famous Martin All-Purpose Chair-Table, the Steelflex Physicians Examining Table, and a variety of Shampaine quality furniture and accessories. Literature will also be available illustrating and describing completely new Shampaine Obstetric and Delivery Tables, as well as the new Hermann Major Operating Table which for all-around maneuverability is in a class by itself.

SHARP & DOHME
Booths B-20, B-22

Sharp & Dohme extends a cordial welcome to all visitors at booths B-20 and B-22 where 'Delcos' Protein-Carbohydrate Granules for high-dosage protein therapy will be featured. Protein replacement therapy usually requires large and prolonged dosage—100 to 200 Gm. of protein daily, for several weeks. The simplest route is by mouth, where the only considerable protection from wasteful use as energy by the presence of carbohydrate, 30%, and wholly palatable even in big doses, maintained for weeks.

SHAY MEDICAL AGENCY
Booth A-7

Blanche Shay, Director, and other representatives of the Shay Medical Agency extend a warm and cordial invitation to all to visit them. There you may discuss your employment problem in strict confidence. Whether you are an employer seeking help or an applicant seeking a position, they can assist you. Your employment problem is their business—let them solve it for you.

THE SMITH-DORSEY COMPANY
Booth B-4

Aminophylline Suppositories and Estrogenic Hormones will be shown at the Smith-Dorsey exhibit as well as a wide variety of injectable preparations. Physicians are invited to make the Dorsey booth their headquarters during the show. Representatives will be happy to discuss the background and use of all products on display.

SMITH, KLINE & FRENCH LABS.
Booth D-7

The effectiveness of 'Benzedrine' Sulfate, N.N.R. (racemic amphetamine sulfate, S. K. F.) in controlling appetite in the treatment of overweight makes it imperative that every physician be conversant with the facts regarding this modern drug which alone successfully inhibits appetite. The use of thyroid in conjunction with 'Benzedrine' Sulfate is obviously superfluous say the manufacturers since thyroid is felt to be of virtually no value in weight reduction and may even be injurious, except when used alone to correct hypothyroidism.

E. R. SQUIBB & SONS
Booth B-9

Squibb will present televised surgical and clinical procedures at this year's AMA Interim Session. Television cameras will be located at the Firmin Desloge, St. Mary's and Barnes Hospitals. Programs will be presented over Station KSD-TV. Further information may be had at the Squibb Technical Exhibit—Booth B-9. Cooperating in the presentation are the Rev. Alphonse M. Schwitalia, Dean of St. Louis University School of Medicine, and Dr. Robert A. Moore, Dean of Washington University School of Medicine.

STEPHENSON CORPORATION
Booth C-13

In C-13 will be shown all models of the Stephenson Resuscitator. See how you can now reduce operating pressures as indicated and mix air with oxygen as signs of anoxia disappear. This leaves an inert gas in the alveoli and prolongs the life of the oxygen tank.

R. J. STRASBURGH CO.
Booth B-30

Easier and more effective means of managing superficial mycotic infections featuring the latest development in fatty acid therapy—Caprylic Acid and its salts—will be on display here for your evaluation. Members of the professional service staff of Strasburgh will be at your service.

SWIFT & COMPANY
Booth A-18

All-meat baby foods, Swift's Meats for Babies (Strained)—for very young babies—and Swift's Meats for Juniors (Diced)—all exhibited by protein, in six part and liver. These products are also gaining rapid acceptance for adult special diets. Representatives at the Swift & Company

booth will be pleased to have you taste and examine these products and to supply you with informative literature.

TAMPAX INCORPORATED
Booth C-14

With the protection, preference for the T. . . . menstrual to review the authoritative information on appropriate use of the three absorbencies—JUNIOR, REGULAR and SUPER. Trained educational consultants will welcome an opportunity to discuss these exclusive features with you at Booth C-14. You will also be interested in seeing the new Tampax Vendor! Ready accessibility, better sanitation and reduction in plumbing problems are a few of the advantages cited in current reports from installations.

CHARLES C THOMAS, PUBLISHER
Booth D-5

New monographs on speciality subjects for the general practitioner and for the specialist as well will highlight the Charles C. Thomas Publishers exhibit. Examples of these are: *Bast and Anson—THE TEMPORAL BONE AND THE EAR; De-Courcy and SURGERY; me—THE SURGICAL RADIOLOGICAL PLASTIC GERY; See AGENTS.* Many new titles have been added in the American Lecture Series since the last meeting of the American Medical Association.

U. S. VITAMIN CORP.
Booth D-16

Enlarged color photographs of common oral lesions of nutritional deficiencies including glossitis, cheilosis, gingivitis and others . . . as well as improvement following administration of complete vitamin therapy . . . will attract your attention here. Illustrated literature, will be offered.

THE UPJOHN CO.
Booths B-8, B-10

"Adrennl Cortex and Resistance" is the theme of the Upjohn exhibit. The central panel symbolizes that man's resistance to stress is being increased by science. The other panels show the effect on the adrenals of various stresses—infection, exercise, surgery, and anoxia. The final panel shows the relative potency of adrenal cortex sterile solution and lipo-adrenal cortex sterile solution.

WALGREEN DRUG STORES
Booth A-19

Something new in technical exhibits awaits you at the Walgreen booth, A-19—a panoramic display of the latest accepted pharmaceutical developments in each field of medicine together with descriptive literature on each of the products. Members of the medical profession are cordially invited to stop by. "You're always welcome at Walgreens!"

WALLACE & TIERNAN PRODUCTS, INC.
Booth D-6

Visiting physicians are cordially invited to visit the Wallace & Tiernan exhibit, booth D-6. In addition to the widely used prescription amid, Monomestrol will display Soltrade Accepted sclerosing veins. treatment of varicose veins.

WHIRLPOOL CARRIAGE, INC.
Booth D-18

of this exhibit is of the Schroeter ch offers partial and complete whirlpool therapy in any tub. The patient can be manipulated while receiving whirlpool therapy for every part of the body. Spray therapy is also featured. The carriage is a compact, portable and well-constructed piece of home, office and hospital equipment.

WHITE LABORATORIES, INC.
Booths B-6, C-15

White's Dienestrol Tablets and Dienestrol Suspension (Council Accepted)—a new orally effective synthetic estrogen—will be featured here. Complete information and literature regarding the advantages of

Dienestrol's high biologic activity, excellent patient-tolerance, and economy will be available. Other products of White Laboratories, Inc. will be on display and White's Medical Service Representatives in attendance will be pleased to supply any further information requested.

THE WILLIAMS & WILKINS CO.
Booth A-23

The Williams and Wilkins Company, Medical Book Publishers, will exhibit several new titles including *Grullee and Eley, The Child in Health and Disease; Rehmuss, Albrecht, and Price, Practical Therapeutics; and Kemp, Elementary Anesthesia.* A special feature of the exhibit will be Brodsky's *Atlas of Oral and Facial Lesions*, which comprises a book of text and 100 picture slides in color. See the Williams and Wilkins Exhibit at Booth A-23.

WINTHROP-STEARN'S, INC.
Booth B-3

WINTHROP-STEARN'S, INC. extends a cordial invitation to visit their booth where they will feature transparencies of beautiful medical art by Mr. Leon Schlossberg. This well-known artist was a pupil and associate of the late Max Broedel, the dean of medical artists and first American professor of medical art (at Johns Hopkins University). His work reflects the impressive style of Broedel to which has been added a unique transparency technique. The exhibit includes (1) kidney with renal pelvis and calices; (2) cardiovascular failure and edema; (3) brain, including visualization of the thalamus, hypothalamus, and medulla oblongata.

WOODWARD MEDICAL PERSONNEL BUREAU
Booth A-32

An opportunity to discuss your personnel problems is offered by the Woodward Medical Personnel Bureau in Booth A-32. Many attractive openings from coast to coast and some interesting foreign possibilities are available. Whether your needs are for the present or future, stop by and become acquainted with this organization which has served the profession for 52 years.

WYETH INCORPORATED
Booth A-26

Wyeth Incorporated will devote special attention to their two distinctive specialties: MEONINE (dl-methionine) and NEOHETRAMINE. Meonine (in tablet form for oral use and crystalline for injection) is an important supplement to high protein diets in the treatment of liver damage, especially portal cirrhosis. NEOHETRAMINE is a remarkably safe antihistamine for the relief of allergic symptoms. Syrup Neohetramine, especially useful for infants and children, is also compatible with other drugs in prescriptions for coughs and colds.

THE YEAR BOOK PUBLISHERS
Booth D-3

At booth D-3, you will find the 1948 Year Books as well as general practice manuals and monographs which offer daily usefulness. Timely books to note include: *Greenhill's Office Gynecology* (5th Edition) and *Obstetrics in General Practice* (4th Edition); *Wright's Vascular Diseases in Clinical Practice*; *Young's Skull, Sinuses & Mastoids*; *Compere & Banks' Pictorial Handbook of Fracture Treatment*; and many others. You are invited to request any of these publications for 10 days' examination.

F. E. YOUNG & CO.
Booth C-30 (n/2)

F. E. Young & Company in booth C-30 will demonstrate Sulf-A-Test, an accurate ten second urine test for all sulfa drugs. Sulf-A-Test will show: (1) If previous treatment has been given; (2) If the kidneys are excreting the sulfa compounds after the initial dose; (3) The approximate mgs. % in the blood per 100 cc.; (4) If renal damage has been done. In such cases the sulfonamide compounds will be present after they normally should have been excreted from the body.

ZENITH RADIO CORP.
Booth C-19

At booth C-19 the Zenith Radio Corporation will exhibit the new Zenith '75' Hearing Aid—the radionic instrument formally announced to the profession in the *Journal of the American Medical Association* of February 28, 1948. Zenith representatives will be pleased to explain a plan whereby the '75' can be tested by any physician without cost or obligation to him or his hard-of-hearing patients.

ORGANIZATION SECTION

Washington Letter

(From a Special Correspondent)

Oct. 25, 1948.

"Walk Outs" at Veterans Administration Hospitals

An exhaustive study of irregular discharges, or "walk outs," of patients under treatment for tuberculosis in veterans' hospitals has been completed, and publication of the findings is scheduled for the near future. The investigation was made by William B. Tollen, Ph.D., of the Veterans Administration Research Division, at the request of Dr. J. B. Barnwell, chief of the Tuberculosis Division in the Department of Medicine and Surgery.

Between July 1946 and June 1947, the one year period covered by the survey, about 6,000 patients terminated their hospitalization without medical sanction, the study revealed. These irregular discharges outnumbered regular discharges by nearly 1,000.

According to data collected by social workers, measures most frequently mentioned which might have been effective in lowering the irregular discharge rate were: (1) intensive social case-work with the veteran and his family during and prior to hospitalization, (2) psychiatric treatment, and orientation of the hospital staff to a keener awareness of the emotional and psychic states of the tuberculous patient, (3) more personalized attention by staff members, (4) more careful and considerate application of hospital rules, policies and procedures governing hospitalization and (5) more sympathetic and discriminating applications of policies relative to pass privileges.

"Tuberculosis is a social as well as a medical problem," says the yet unpublished Tollen report. "Irregular discharge, which is part and parcel of the problem of treatment of tuberculosis, must be recognized as essentially a social problem. Tuberculous patients walk out of hospitals before treatment is completed because of the "push and pull" factors inside and outside the hospital that force them out. To prevent irregular discharges it is necessary to counteract these forces, to treat the total patient and not only the physical manifestations of his disease. The tuberculous patient needs help and support to withstand the emotional and psychic strains that hospitalization for tuberculosis produces.

"VA cannot by itself solve the problem of irregular discharge of tuberculous veterans, since the problem is basically social, a problem for the community at large. Failure of the community actively to seek a solution is costing the community more than the expense of eliminating and preventing irregular discharge of the tuberculous. Whoever can devise a method of convincing the community of this fact will serve not only the tuberculous but every other citizen as well."

Legion Still Cool Toward AMA-AHA Hospitalization Plan

It is still problematic whether the American Legion, at its national convention in Miami this month, will take up the veterans hospitalization proposal advanced last month by a committee representing American Medical Association and American Hospital Association. To date Washington offices of the Legion have not supplied certain factual data required for revision of the AMA-AHA prospectus which was presented to the Legion's medical advisory board, and there are definite signs that the veterans organization is opposed to the plan—provision for hospitalization of non-service-connected disabilities in nongovernmental hospitals, rather than in those operated by Veterans Administration, thereby permitting curtailment of VA's huge hospital expansion program and giving the prospective patient greater flexibility in choice of hospital and physician. Although it is possible that the issue will be discussed and acted on at the Miami convention, the fact that the advisory board has not yet passed on the proposal—even in principal—reduces the likelihood of such action.

Hawley Board Completes Pacific Field Trip

Members of the Committee on Medical and Hospital Services of the Armed Forces ("Hawley Board") have returned to Washington from a twenty-one day airplane tour of military medical facilities in Hawaii, Guam, Japan and Alaska. Recommendations designed to increase efficiency of medical and hospitalization operations through integration of Army, Navy and Air Force activities are in process of preparation for transmittal to Secretary of Defense James Forrestal. In Japan the committee members conferred with General Douglas MacArthur.

"Commanders of the three services facilitated immeasurably the studies being made by the committee," said Rear Admiral Joel T. Boone, executive secretary. "These field trips have contributed very materially to the wealth of information the committee has gathered for analysis."

Coming Medical Meetings

American Medical Association Interim Session, St. Louis, Municipal Auditorium, Nov. 30-Dec. 3. Dr. George F. Lull, 535 N. Dearborn St., Chicago 10, Secretary.

Annual Conference of State Secretaries and Editors, St. Louis, Hotel Statler, Nov. 28-29. Dr. George F. Lull, 535 N. Dearborn St., Chicago 10, Secretary.

National Medical Public Relations Conference, St. Louis, Hotel Statler, Nov. 27. Mr. Lawrence W. Rember, 535 N. Dearborn St., Chicago 10, Director.

American Academy of Dermatology and Syphilology, Chicago, Palmer House, Dec. 5-9. Dr. Earl D. Osborne, 471 Delaware Ave., Buffalo, Secretary.

American Academy of Pediatrics, Atlantic City, Chalfonte-Haddon Hall, Nov. 20-23. Dr. Clifford G. Grulee, 636 Church St., Evanston, Ill., Secretary.

American Association of Railway Surgeons, Chicago, Nov. 21-23. Dr. Raymond B. Kepner, 547 W. Jackson Blvd., Chicago 6, Secretary.

American Clinical and Climatological Association, Hot Springs, Va., The Homestead, Nov. 8-10. Dr. James Bordley III, Bassett Hospital, Cooperstown, N. Y., Secretary.

American Public Health Association, Boston, Nov. 8-12. Dr. Reginald M. Atwater, 1790 Broadway, New York 19, Executive Secretary.

American Society for the Study of Arteriosclerosis, Chicago, Hotel Knickerbocker, Oct. 31-Nov. 1. Dr. O. J. Pollak, Quincy City Hospital, Quincy 69, Mass., Secretary.

American Society of Anesthesiologists, St. Louis, Hotel Statler, Nov. 4-6. Mr. John H. Hunt, 188 W. Randolph St., Chicago 1, Executive Secretary.

Association for Research in Nervous and Mental Diseases, New York, Waldorf-Astoria Hotel, Dec. 10-11. Dr. Clarence C. Hare, 700 W. 168th St., New York 32, Secretary.

Association of Military Surgeons of the United States, San Antonio, Texas, Nov. 11-13. Dr. James M. Phalen, Army Institute of Pathology, Washington 25, D. C., Secretary.

Eastern Section, American Federation for Clinical Research, Philadelphia, Temple University School of Medicine, Dec. 4. Dr. J. Edward Berk, Temple University School of Medicine, Philadelphia, Chairman.

International College of Surgeons, U. S. Chapter, St. Louis, Kiel Auditorium, Nov. 16-19. Mr. Ralph E. Osborne, 1516 Lake Shore Drive, Chicago, Business Secretary.

Inter-State Postgraduate Medical Association of North America, International Medical Assembly, Cleveland, Public Auditorium, Nov. 9-12. Dr. Tom B. Throckmorton, 406 Sixth Ave., Des Moines, Iowa, Secretary.

Puerto Rico, Medical Association of, Santurce, Dec. 10-12. Dr. J. Basora Defillo, Box 3866, Santurce, Secretary.

Radiological Society of North America, San Francisco, Dec. 5-10. Dr. Donald S. Childs, 607 Medical Arts Bldg., Syracuse 2, N. Y., Secretary.

Southern Psychiatric Association, Dallas, Texas, Hotel Adolphus, Dec. 6-7. Dr. Newdigate M. Owensby, 384 Peachtree St. N.E., Atlanta, Ga., Secretary.

Southern Surgical Association, White Sulphur Springs, W. Va., Dec. 7-9. Dr. Alfred Blalock, Johns Hopkins Hospital, Baltimore 5, Secretary.

Western Surgical Association, St. Louis, Dec. 2-4. Dr. Warren H. Cole, 1853 W. Polk St., Chicago, 12, Secretary.

GOVERNMENT SERVICES

ARMY

FOOD INSTITUTE OF THE ARMED FORCES

George H. Berryman, Ph.D., has been named head of the Nutrition Branch of the Quartermaster Food and Container Institute for the Armed Forces, which is located in Chicago. Dr. Berryman will direct basic research on nutritional aspects of food used by the Armed Forces or procured by the Department of National Defense for feeding programs in other parts of the world. During the war, Dr. Berryman was Commanding Officer and Director of Research of the Medical Department's Nutrition Laboratory in Chicago. He received his doctorate at the University of Minnesota (Mayo Foundation) and is at present completing additional work at the University of Chicago Medical School which will lead to the M.D. degree.

Harry Spector, Ph.D., has joined the research staff of the Quartermaster Food and Container Institute for the Armed Forces, which is a laboratory of the Research and Development Branch of the Quartermaster General's Office. Dr. Spector will direct research on the effect of military operations on physiologic processes and also on the physiologic effects promoted by the feeding of processed foods deficient in nutritional content. He received his doctorate at the University of Wisconsin, where he was engaged in biochemical research, and later was on the faculty of the University of Illinois for five years.

Mr. Albert S. Henick recently became a member of the Chemical Branch of the Food and Container Institute, and Mr. Jack Mayer has been assigned to the Animal Products Branch. Mr. Henick formerly was with the laboratories of the American Meat Institute, conducting research principally on the autoxidation of fats, while Mr. Mayer for twelve years was with the United States Food and Drug Administration and for four years was on seafood inspection duties in the New Orleans area.

ARMY MEDICAL LIBRARY

At the October 21 meeting of the Association of Honorary Consultants to the Army Medical Library, the Nominating Committee nominated Dr. Morris Fishbein to succeed himself for a four year term on the Executive Committee, and Colonel Joseph H. McNinch, MC, USA, the Director of the Army Medical Library, was nominated to be Secretary of the Association for a term of three years.

The late Mrs. Emma Wheat Gilmore bequeathed a sum of money to the Army Medical Library for the establishment of a fund to be known as the Gilmore Bequest, to be used at the discretion of the Surgeon General for the benefit of the library.

The next meeting of the Committee of Consultants for the Study of the Indexes to Medical Literature published by the Army Medical Library will be in the latter half of November, at which meeting the persons preparing the indexes now in use will be asked to explain the preparation of their publications to the Committee.

TRAINING IN CIVILIAN INSTITUTIONS

The following additional Medical Department officers have been accepted by civilian schools and hospitals for training: Lieut. Colonels Stephen W. Ranson, Washington-Baltimore Psychoanalytic Institute, Baltimore, psychoanalysis; Louis S. Leland, Bellevue Hospital, New York, dermatology; Majors Frank A. Goss and Frank E. Bunts, Educational Institute, internal medicine; John F. Harris, Minnesota Department of Health, St. Paul, communicable disease control; Alfred A. Hellams, Cook County Graduate School of Medicine and Illinois Neuropsychiatric Institute, Chicago, neurology; Captains Richard A. Hayden, St. Mary's Hospital, Brooklyn, obstetrics and gynecology; Robert L. Koenig, New York University, New York, tropical medicine; Roy E. Campbell, Grady Memorial Hospital, Atlanta, Ga.; First Lieutenants Harry F.

Sproat, New York University, New York, tropical medicine; Charles A. DeLaney, Santa Monica Hospital, Santa Monica, Calif., intern training; Julio A. Ortiz, Freedmen's Hospital, Washington, D. C., intern training; Robert G. Rodriguez, St. Mary's Hospital, Philadelphia, intern training; Jean Brunkow, University of Colorado Medical Center, Denver, poliomyelitis course, and Second Lieutenant Barbara Ricker, University of Colorado Medical Center, Denver, course on poliomyelitis.

ADVANCED TRAINING IN CIVILIAN INSTITUTIONS

The following medical officers have been accepted for training in the civilian medical schools and hospitals indicated: Lieut. Col. Theodore E. Fischer, basic science, Georgetown University, Washington, D. C.; Major Gerald M. McDonnell, atomic medicine, University of Rochester, N. Y.; Lieuts. Joshua C. Bray, intern training, Abingdon Memorial Hospital, Abingdon, Va.; Robert H. Reid, intern training, New Haven Community Hospital, Conn.; Boyd C. Hindall, intern training, University of Minnesota Hospital, Minneapolis; William H. Sellors, intern training, Shadyside Hospital, Pittsburgh; Darrell J. Holman, intern training, Los Angeles County Hospital, Los Angeles; Raymond C. Mellinger, intern training, Henry Ford Hospital, Detroit; George W. Weber, intern training, Community General Hospital, Reading, Pa.; Moses M. Hartman, intern training, Community General Hospital, Reading, Pa., and Oliver R. Buesing, surgery, Emory University, Emory, Ga.

CERTIFICATIONS BY AMERICAN BOARDS

Eight additional Regular Army medical officers have recently been certified by American Boards. They are: Brig. Gen. Leonard D. Heaton, general surgery; Col. Oral B. Bolibaugh, orthopedic surgery; Lieut. Col. Edward A. Cleve, internal medicine; Lieut. Col. Richard L. Crone, internal medicine; Lieut. Col. Hugh W. Jones, Pathologic Anatomy and Clinical Pathology; Lieut. Col. Ryle A. Radke, internal medicine; Lieut. Col. Jack W. Schwartz, urology, and Major Jack H. Bristow, ophthalmology.

VISITORS AT MEDICAL MUSEUM

The Army Medical Museum of the Army Institute of Pathology, Washington, D. C., reports a record attendance of 3,041 visitors for Labor Day week end, which brings the total attendance of visitors for the last sixteen months to more than 175,000.

INSTITUTE OF PATHOLOGY

Dr. Arthur T. Hertig, Boston, delivered a special lecture on "Classification and Biological Behavior of Hydatid Moles" at the Army Institute of Pathology, Washington, D. C., September 24.

PERSONALS

Major Gen. John M. Willis, M. C., retired, has accepted a position as superintendent of Hamot Hospital at Erie, Pa. During the recent war General Willis was commanding officer of Camp Grant and the training school there for medical corpsmen and, after that assignment, served in the Pacific area.

The Surgeon General of the Army has appointed Dr. Ebbe C. Hoff, associate professor of neurophysiology at the Medical College of Virginia, Richmond, a member of a committee of consultants to advise on the indexing of medical literature. The committee will be under the direction of Dr. Lewis H. Weed, head of the committee on medical research of the National Research Council.

NAVY

NEW NAVY INTERNS

The following recent medical school graduates have accepted nominations as lieutenants (jg) in the Medical Corps Reserve under the Navy's Medical Intern Training Program. On completion of their internships, these young doctors will serve on active duty in the Navy: George F. Ashbury, Kent, Wash., to King County Hospital, Seattle; Arthur F. Boon, Grand Haven, Mich., to Detroit Receiving Hospital, Detroit; William W. Drummy Jr., Omaha, to Boston City Hospital, Boston; William J. Dunn, Wilmette, Ill., to Philadelphia General Hospital, Philadelphia; Edward A. Felder, Norwich, Conn., to Delaware Hospital, Inc., Wilmington, Del.; George R. Hanson, Nampa, Idaho, to St. Luke's Hospital, Denver; Saul I. Harrison, New York, to Western Pennsylvania Hospital, Pittsburgh; Robert C. Hastedt, Harrisburg, Pa., to George F. Geisinger Memorial Hospital, Danville, Pa.; George J. Haupt, Pittsburgh, to Jefferson Hospital, Philadelphia; Robert E. Herndon, Seminole, Okla., to St. Luke's Hospital, St. Louis; Harold H. Hopper, Monrovia, Calif., to Jefferson Hospital, Philadelphia; Robert W. Johnson, Alliance, Neb., to St. Luke's Hospital, Denver; Erling P. O. Larson, Davenport, Iowa, to City Hospital, St. Louis; Henry Litvin, Philadelphia, to Philadelphia General Hospital, Philadelphia; Paul T. Luckenbill, Kutztown, Pa., to University of Kansas Medical Center, Kansas City, Kan.; Joseph A. Mayer, Salt Lake City, to Holy Cross Hospital, Salt Lake City; Floy J. Moore, Moundsville, W. Va., to Presbyterian Hospital, Chicago; John P. Morris, Scarsdale, N. Y., to Grasslands Hospital, Valhalla, N. Y.; John A. Owen Jr., South Boston, Va., to Cincinnati General Hospital, Cincinnati; and Charles R. Propst, Sumter, S. C., to Philadelphia General Hospital, Philadelphia.

POSTGRADUATE INSTRUCTION

The following medical officers of the Regular Navy have been nominated to attend postgraduate instruction at the institutions indicated: Comdr. John D. Walters, residency in dermatology and syphilology, University of Pennsylvania Graduate School of Medicine, Philadelphia; Lieut. Comdr. George W. Russell, fellowship in surgery, Georgetown University Hospital, Washington, D. C.; Lieuts. Henry G. Gardiner Jr., instruction in neuropsychiatry, University of Texas Medical Branch, Galveston; Walter H. Jarvis Jr., residency in general practice, Naval Hospital, Portsmouth, Va.; Lieuts. (jg) Raleigh M. Hood, residency in surgery, Naval Hospital, San Diego, Calif.; William K. Woodard, residency in pediatrics, Naval Hospital, Chelsea, Mass.

PERSONALS

Lieutenants (jg) George T. Van Petten and Burton Willard have recently transferred from active Reserve status to the Medical Corps of the Regular Navy.

Dr. Friedrich P. Ellinger of Koenigsberg, Germany, has joined the staff of the Research Institute at the Naval Medical Center, Bethesda, Md., as the technical director of research in radiation biology. Dr. Ellinger came to the United States in 1938 and has been director of the Laboratory for Experimental Radiation Therapy Research at Long Island College of Medicine and consultant in radiology in charge of research at the United States Veterans Hospital, Bronx, N. Y.

Captain Henry D. Hubbard, MC, has been assigned to London, England, as staff Medical Officer, United States Naval Forces, Eastern Atlantic and Mediterranean.

MISCELLANEOUS

VANNEVAR BUSH RESIGNS

Vannevar Bush has resigned as chairman of the Research and Development Board of the National Military Establishment and will be succeeded in that position by Dr. Karl T. Compton, president of Massachusetts Institute of Technology. Dr. Bush received a master of science degree from Tufts College and has received honorary degrees from numerous other institutions of learning. He has been a teacher at his alma mater and at the Massachusetts Institute of Technology, and since 1939 he has been president of the Carnegie Institution of Washington. He is a trustee of Johns Hopkins University, a life member of the Massachusetts Institute of Technology Corporation, regent of the Smithsonian Institute; chairman of the National Defense Research Commission and, since 1941, director of the Office of Scientific Research and Development.

Dr. Compton is a graduate of Wooster College, Wooster, Ohio, and received his Ph.D. from Princeton University in 1912 and has received honorary degrees from many colleges and universities. He has been chairman of the Nutrition Foundation since 1941, a trustee of the Memorial Foundation for Neuro-Endocrine Research of Boston since 1932 and Brookings Institute since 1940. He was chairman of the United States Radar mission to the United Kingdom and a member of several special advisory committees on the atomic bomb. He has been president of the Massachusetts Institute of Technology since 1930.

physiology and will correlate activities of existing military and civilian laboratories in its field. The panel on shipboard and submarine medicine will be under the direction of Dr. E. J. DuBois, professor of physiology at Cornell University School of Medicine, New York. This panel will study methods of protection against undesirable conditions, means of increasing efficiency of personnel and treatment of conditions peculiar to shipboard and submarine operations, as well as the evaluation of factors influencing human function under environmental conditions related to the operation of ships and submarines.

A chairman has not yet been selected for the panel on military and field medicine, which will be responsible for coordination of research in medical and allied sciences concerned with support of troops under field conditions and will study problems related to hospitals, dispensaries and disaster situations.

The chairman of the Medical Sciences Committee is Dr. Francis C. Blake, who has just announced the appointment of Major General Malcolm C. Grow, the Air Surgeon, as Air Force representative on the committee.

MASS BCG VACCINATION IN EUROPE

The United Nations International Children's Emergency Fund contemplates tuberculin testing 40 to 50 million children in Europe and offering vaccination to all who are found uninfected by the tubercle bacillus. The Children's Fund has already allocated \$4,000,000 for the work, and the program will begin shortly under the sponsorship of the World Health Organization, the Danish Red Cross and other Scandinavian Red Cross chapters, and UNICEF. On October 2, Drs. Carroll E. Palmer and Lydia B. Edwards, Senior Surgeons of the United States Public Health Service, left New York for Paris to consult with Dr. Johannes Holm, director of the vaccination program, on the research implications of the undertaking. After completion of the European program, similar undertakings may be made in China, Southeast Asia, Latin America, Algeria, Tunisia and Morocco.

MEDICAL SCIENCES COMMITTEE APPROVES THREE PANELS

The Committee on Medical Sciences of the Research and Development Board, National Military Establishment, has set up three panels: aviation medicine, shipboard and submarine medicine, and military and field medicine. The panel on aviation medicine will be under the direction of E. J. Baldes, Ph.D., chairman of the Division of Physics and Biophysical Research, Mayo Clinic, Rochester, Minn. This panel will study medical problems involved in crash and safety programs and aviation

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CONNECTICUT

State Hospital Appointments.—Dr. Ronald H. Kettle was appointed superintendent of the Norwich State Hospital, effective August 25. He has been acting superintendent since July 1948, when Dr. Riley H. Guthrie resigned. Dr. Conrad O. Ranger was appointed clinical director of the hospital beginning October 1. He has been consultant for the Veterans Administration at Manchester, N. H.

Research in Electroencephalography.—The Institute of Living at New Haven announces the appointment of Charles E. Henry, Ph.D., Chicago, to direct the expanded research program in electroencephalography and allied studies. Dr. Henry comes to Hartford from the Institute for Juvenile Research in Chicago. He was in charge of the electroencephalographic program for the Navy at Newport. Before his military service he had taught at Western Reserve University, Cleveland, and the State University of Iowa, Iowa City, and had been associated with the Bradley Home and School for Children in Providence, R. I.

ILLINOIS

Personal.—Dr. Maurice Lev, director of research in the department of pathology at Michael Reese Hospital, has been appointed assistant professor of pathology at the University of Illinois College of Medicine. Dr. Lev is a graduate of Creighton University School of Medicine, Omaha, 1934.

First State Tuberculosis Sanatorium.—Ground-breaking ceremonies marking the beginning of the first state hospital for the care of tuberculous patients were held at Mt. Vernon October 15. The sanatorium is to be constructed under the state-federal hospital construction program. Known as the Mt. Vernon State Tuberculosis Sanatorium, it will have a capacity of one hundred beds. Representatives of the Illinois State Medical Society, Illinois Hospital Association and the Illinois Tuberculosis Association, members of the state advisory council on hospitals, county sanatorium boards, local health, welfare and tuberculosis associations and the general public attended.

Chicago

Varicose Veins and Epilepsy.—The North Shore Branch of the Chicago Medical Society, meeting on November 2 at the Edgewater Beach Hotel, will hear Dr. Geza De Takats, University of Illinois, speak on the treatment of varicose veins. Dr. Frederick A. Gibbs, also of the University of Illinois, will speak on "Psychomotor Epilepsy."

Address by Dr. Ditttrick.—Dr. Howard Ditttrick, associate professor of medical history, Frank E. Bunts Educational Institute, Cleveland, will address a joint meeting of the Institute of Medicine of Chicago and the Society of Medical History of Chicago in the assembly room of the institute, John Crerar Library Building, November 19, on "Temple to Hospital in Care of the Sick."

Course in Endocrinology.—The American College of Surgeons is offering a course in endocrinology at La Salle Hotel, Chicago, November 1-6, which will present a review of recent developments in the field of endocrinology by leading teachers in the United States and Canada. The fee is \$30 for members and \$60 for nonmembers. The course is under the direction of Dr. Willard O. Thompson, clinical professor of medicine, University of Illinois College of Medicine.

INDIANA

Dr. Shumacker to Head Surgical Department.—Dr. Harris B. Shumacker Jr., associate professor of surgery at Yale University School of Medicine, New Haven, Conn., has been appointed professor and chairman of the department of surgery at the Indiana University School of Medicine, Bloomington-Indianapolis. Dr. Shumacker received his M.D. degree from Johns Hopkins University School of Medicine, Baltimore, 1932. He was assistant resident in surgery, obstetrics and gynecology at the New Haven (Conn.) Hospital in 1936, and was made resident surgeon the following year. He was an instructor in surgery in 1937-1938 at Yale University and from 1931 to 1948 at Johns Hopkins School of Medicine. He became an associate professor of surgery in 1946. During World War II he served as surgeon with the 118th General Hospital.

IDAHO

State Medical Election.—At the annual meeting of the Idaho State Medical Association, July 5-8, Dr. Franklin B. Jeppesen, Boise, became president and Dr. Walter R. West, Idaho Falls, president-elect; Dr. Alfred L. Popma, Boise, was named secretary-treasurer.

MAINE

State Clinical Meeting.—The Maine Medical Association will hold its clinical session at the Eastland Hotel, Portland, November 1-2. Clinics will be held at the Maine General Hospital, the Maine Eye and Ear Infirmary and Mercy Hospital. A symposium on cancer will be held Tuesday afternoon. Out of state speakers will be Dr. Grantley W. Taylor, Boston, "What Can Be Accomplished in Cancer Therapy," and Dr. T. Duckett Jones, Boston, speaking on "Rheumatic Fever" at the banquet Monday night.

MINNESOTA

Litzenberg Lectures.—The Minnesota Medical Foundation announces the establishment of the Litzenberg Lectures in honor of the late Dr. Jennings C. Litzenberg, formerly head of the department of obstetrics and gynecology at the University of Minnesota Medical School. The first lecture was given October 22 at the university by Dr. Everett D. Plass, of the State University of Iowa College of Medicine, Iowa City, on "Advances in Maternal Welfare."

MISSOURI

Jackson County Health Forum.—The Jackson County Health Forum sponsored by St. Luke's, St. Joseph, St. Mary's, Menorah and Trinity Lutheran hospitals, and approved by the Jackson County Medical Society, opened its twelfth season of lectures in the Municipal Auditorium, Kansas City, September 15. On October 20 the lecture was "A New World for the Hard of Hearing" by Dr. George E. Shambaugh Jr., Chicago; on November 17 Dr. Bayard T. Horton, Rochester, Minn., will speak on "Migraine Headaches"; on January 12, Dr. Cyril M. MacBryde, St. Louis, will lecture on "Modern Trends in Diabetic Treatment." These free lectures are open to the public; they are on the third Wednesday night of each month September through April, with the exception of December.

MISSISSIPPI

Student Loans.—Medical students interested in loans from the State Medical Education Board to become effective at mid-year have until December 1 to make their applications. They must have completed premedical college work and be accepted for enrolment in a class A medical school. On September 25 the State Medical Education Board had granted loans to 144 young men and women of Mississippi who are attending 24 medical schools throughout the nation.

NEW YORK

Rochester Academy Lectures.—On October 5 the Rochester Academy of Medicine began its annual series of lectures, which will continue on the first Tuesday of each succeeding month through May. The next four lectures are:

- Nov. 16, Winslow T. Tompkins, Philadelphia, Nutrition and Pregnancy.
- Dec. 7, I. Arthur Mirsky, Cincinnati, Ohio, Diabetes.
- Jan. 4, Charles R. Allison and Elmer O'Brien, Rochester, and William G. Farlow, Coldwater, Symposium on Bronchiectasis.
- Feb. 1, Milton J. E. Senn, New York, Child Psychology.

Postgraduate Instruction.—The Medical Society of the State of New York with the cooperation of the New York State Department of Health has arranged a lecture for the Jefferson County Medical Society at the Hotel Woodruff, Watertown, November 11, 8 p. m. Dr. Harry A. Steckel, Syracuse, will speak on "Psychosomatic Medicine." For the Lewis County Medical Society Dr. Steckel will lecture on "Alcoholism as a Medical Problem" at the St. Peter's Church, Lowville, November 4 at 8 p. m.

New York City

Physicians Art Club.—The New York Physicians Art Club held its sixteenth exhibition at the New York Academy of Medicine October 20-29. The academy is not open on Saturday or Sunday. There were no jury of awards and no prizes. The public was invited to the exhibition.

Courses in Diseases of the Chest.—A postgraduate course in Diseases of the Chest will be given at the Hotel New Yorker, November 8-13 under the sponsorship of the American College of Chest Physicians and with the cooperation of members of the staffs of the New York City medical schools and hospitals. Morning and afternoon sessions and luncheon round table discussions will be held. Application should be made to the American College of Chest Physicians, 500 North Dearborn St., Chicago 10. The fee is \$50.

Clinical Session on Chronic Pulmonary Diseases.—The Tuberculosis Sanatorium Conference of Metropolitan New York will hold a clinical session on chronic pulmonary diseases at the Cornell University Medical College Amphitheatre, November 10, at 8:15 p. m. A panel discussion will be held on "Bed Rest in the Treatment of Tuberculosis." Dr. Carl Muschenheim will be the moderator.

Public Health Week.—The Beth-El Hospital, Brooklyn, will conduct its annual Public Health Week for the Laity November 8-11. The following topics will be considered:

- Nov. 8, The Rh Factor, by Dr. Philip Levine, New York.
- Nov. 9, Diabetes, by Dr. Benjamin I. Ashe, New York.
- Nov. 10, Rheumatic Fever, by Dr. Leo M. Taran, Brooklyn.
- Nov. 11, Menopause, by Dr. Isadore C. Rubin, New York.

The meeting of November 8 will be held at the Hebrew Educational Alliance; those of November 9 and 10 at the Brooklyn Jewish Center, and that of November 11 at the East Midwood Jewish Center in Brooklyn. All meetings will begin at 8:30.

Twenty-Third Series of Friday Afternoon Lectures.—The New York Academy of Medicine is sponsoring its twenty-third series of Friday Afternoon Lectures open to the medical profession and to medical students at 4:30 beginning November 5 and extending through April 8. The program for the rest of this year is as follows:

- Nov. 5, E. Jefferson Browder, New York, Pain in the Low Back with Radiation into the Lower Extremity.
- Nov. 12, Harry Most, New York, The A. Walter Suiter Lecture, Tropical Diseases in Daily Practice in New York City.
- Nov. 19, Walter T. Dannreuther, New York, Ectopic Pregnancy.
- Dec. 3, Sami Granick, Ph.D., New York, Iron Metabolism and Hemochromatosis.
- Dec. 17, Harold A. Abramson, New York, Asthma.

OHIO

Professor LeBlanc Dies.—Thomas J. LeBlanc, Sc.D., head of department of preventive medicine, University of Cincinnati College of Medicine, died September 9 at Christian R. Holmes Hospital. Dr. LeBlanc was a fellow in 1920 of the Rockefeller Institute, served with U. S. Public Health Service 1924-1925 and had been a member of the faculty of the university since 1925.

BCG Vaccination.—The Academy of Medicine of Cleveland has approved the use of BCG vaccine in the central area of Cleveland. At present, students in the School of Medicine of Western Reserve University and in the nursing schools of several hospitals are being vaccinated. Only persons with no evidence of tuberculosis are to be vaccinated. The work is under the direction of the city commissioner of health and the controller of tuberculosis. U. S. Public Health Service officials are giving technical assistance.

OREGON

Course in Allergy.—A fall graduate instructional course in allergy will be given at the University of Oregon Medical School, Portland, November 8-12 in cooperation with the American College of Allergists. Subjects for lectures are: fundamentals of allergy and miscellaneous manifestations, gastrointestinal and food allergy, dermatologic allergy, miscellaneous manifestations of allergy and respiratory and miscellaneous allergies. The fee for the course is \$75, payable at the medical school registration desk. Applications can be secured by writing Dr. Fred W. Wittich, The American College of Allergists, 423 LaSalle Medical Building, Minneapolis 2, Minn.

SOUTH CAROLINA

Portrait of Dr. Barron.—A portrait of Dr. William R. Barron, Columbia, was unveiled August 6 in the new wing of the South Carolina Baptist Hospital. The portrait was provided by fellow members of the Columbia Medical Society of Richland County and close friends. Dr. Barron, now retired, practiced for many years in Columbia.

Alumni Postgraduate Seminar.—The Alumni Association of the Medical College of the State of South Carolina will hold a seminar at the college November 2-4. The speakers will be:

- R. Glenwood Spurling, Louisville, Ky., Lumbar Intervertebral Disc Lesions.
- Alexander Brunswick, New York, Some Very Favorable Results in the Treatment of Advanced, So-Called Inoperable, Abdominal Carcinoma.
- John B. McKittrick, Boston, Surgery in the Diabetic.
- Allan M. Butler, Boston, Treatment of Diarrheal Disease in Infancy.
- Paul Titus, Pittsburgh, Research in Obstetrics and Gynecology.
- Emmett D. Colvin, Atlanta, Management of Prolonged Labor Due to Uterine Inertia.
- Wallace M. Yater, Washington, D. C., Coronary Artery Disease.
- Edgar Hull, New Orleans, The Diagnosis and Treatment of Peptic Ulcer.
- Shields Warren, Boston, Diagnostic and Therapeutic Use of Radioactive Isotopes.

At the Founders' Day Banquet November 4 Dr. Warren will speak on "The Atomic Age in Medicine."

TENNESSEE

Additional Radioisotope Courses.—The Oak Ridge Institute of Nuclear Studies will offer four additional courses in technics of using radioisotopes in research this fall and winter. New courses and priority of attendance are: Oct. 25, industrial laboratories; Jan. 3, 1949, government laboratories; Feb. 14, 1949, medical personnel, and March 14, 1949, no priority assigned. The four week courses are designed to teach scientists how to apply radioisotopes in their own research safely. Participants are selected by the institute with the assistance of the Isotopes Division and the Division of Biology and Medicine of the Atomic Energy Commission, and preference is given to persons who are almost ready to use radioisotopes in their research. The courses are about two thirds laboratory work and one third lecture and seminars. For further information write the institute at P.O. Box 117, Oak Ridge.

Circuit Postgraduate Instruction in Cancer.—Dr. Lyndon E. Lee Jr. of the University of Michigan, Ann Arbor, is continuing the postgraduate instruction courses in cancer begun a year ago by the Tennessee State Medical Association, the Tennessee Division of the American Cancer Society, the State Department of Public Health, Vanderbilt University School of Medicine, Nashville, and the University of Tennessee College of Medicine, Memphis. He is giving ten week courses to five groups in east Tennessee in a circuit known as Sweetwater Valley, where two hundred and fifty-three doctors are enrolled. The program has another nine months to function. In the first year Dr. Lee covered twenty-five teaching centers and about fifty counties, where five hundred and eighteen physicians were enrolled. On completion of this circuit, the state medical association hopes to open immediately a two year program on "Psychiatry, as Applied to the Practice of Medicine." Any medical school or hospital that will grant a leave of absence to a physician qualified to give this course should communicate with Dr. T. S. Hill, co-chairman, Postgraduate Committee, Gailor Memorial Psychiatric Hospital, Memphis 7.

TEXAS

Dr. DeBakey Appointed Professor of Surgery.—Dr. Michael E. DeBakey, associate professor of surgery at Tulane University of Louisiana School of Medicine, New Orleans, has been appointed Judson L. Taylor professor of surgery at Baylor University College of Medicine, Houston. Dr. DeBakey was born in Lake Charles, La., 1908, is a graduate of Tulane and has been on the staff of Touro Infirmary and visiting surgeon at Charity and Mercy hospitals in New Orleans. He is the author or co-author, chiefly with Dr. Alton Ochsner, of numerous surgical papers. During the war he served in the general surgery branch, Surgical Consultants Division, office of the Surgeon General. He has lately been appointed a member of the medical advisory committee of the National Security Resources Board.

WASHINGTON

Poliomyelitis Centers in Eleven Cities.—The State Medical Advisory Committee on Poliomyelitis has approved a plan for the development of "Polio Centers" in eleven cities within the state to aid in the management of local outbreaks of poliomyelitis. The committee, representing various medical, hospital, nursing and similar associations of the state, and serving in an advisory capacity to the State Department of Health and the National Foundation for Infantile Paralysis, will develop and promote the plan. The centers are to have one or more hospitals equipped with special facilities and trained personnel to take care of patients with poliomyelitis.

PUERTO RICO

Examine Imported Flour.—The Department of Health of Puerto Rico has announced that all imports of wheat flour into the island will be examined to determine whether additional vitamins and minerals have been added, as provided by Act no. 182, approved May 12 by the Insular Legislature. Wholesale merchants were given an opportunity up to October 1 to dispose of their stocks of nonenriched flour.

First Tuberculosis Hospital.—Dr. E. Garrido Morales, medical consultant, U. S. Public Health Service in San Juan, speaking before a Tuberculosis Institute, October 3, reported that Puerto Rico needs 11,191 hospital beds; the island has only 2,254, 1,892 of which are operated by the government and 362 by private institutions. The first tuberculosis hospital to be constructed with federal and insular funds will be located at Rico Piedras and will have an eight hundred bed capacity. It is being constructed at a cost of over \$2,000,000. There are twenty-two tuberculosis centers established on the island as compared to 5 in 1935. The work on these centers is performed under the supervision of tuberculosis specialists with fluoroscope equipment and, in the majority of the centers, x-ray equipment.

GENERAL

Annual Meeting of Special Society.—The annual meeting of the American Otorhinologic Society for the Advancement of Plastic and Reconstructive Surgery will be held at the Hotel Waldorf Astoria, New York, on Thursday, November 4. A testimonial dinner will be held at 6 p. m. for Dr. Samuel Fomon, New York, honorary president, who will speak on "Recent Development in Rhinoplastic Surgery Based on New Physiologic Concepts."

Anesthesiologists Meeting.—The American Society of Anesthesiologists will hold its annual meeting at the Statler Hotel, St. Louis, November 3-6, under the presidency of Dr. Charles F. McCuskey, Los Angeles. The scientific program, beginning November 5, includes symposiums on recent developments affecting anesthesiologists; the practice of anesthesiology; blood; blood substitutes; supportive therapy and associated pathology, and anesthesia and related problems in infants and children.

Poliomyelitis Declines Sharply.—The U. S. Public Health Service reports a decrease of 321 cases of poliomyelitis during the week ended October 9 as compared with the preceding week, the sharpest weekly decline this year. A total of 1,208 cases was reported for the week, as compared with 1,529 for the previous week, 1,142 in 1946 and a five year median of 639 for the corresponding week. The week's report brings the total to October 9 to 20,387, as compared with 19,644 in 1946 and a five year median of 10,296. The total for the entire year 1946 was 25,698. The following states have reported more than 1,000 cases to date: California 3,512, North Carolina 2,293, Texas 1,520 and New York 1,145.

Meeting of Association of Medical Colleges.—The annual meeting of the Association of American Medical Colleges will be held at the Hotel Greenbrier, White Sulphur Springs, W. Va., November 8-10. Among the speakers will be:

Cassius S. Van Slyke, Bethesda, Md., Relation of National Heart Act to the Medical Schools.

Stafford L. Warren, Los Angeles, Role of Biophysics in Medical Education.

Walter A. Bloedorn, Washington, D. C., Financial Aid to Medical Education.

Donald Slaughter, Vermillion, S. D., Clinical Clerkships for Sophomore Medical Students.

Major General Lewis B. Hershey, Washington, D. C., will give the dinner address.

Meeting of Radiological Society.—The annual meeting of the Radiological Society of North America will be held at the Fairmont Hotel, San Francisco, December 5-10 under the presidency of Dr. Leo H. Garland, San Francisco. Refresher courses on radiologic diagnosis and treatment and symposiums are included in the program. Among the speakers will be Drs. Fuller Albright, Boston; James F. Brailsford, Birmingham, England; William E. Chamberlain, Philadelphia; S. de Rienzo, Cordoba, Argentina; J. Frimann-Dahl, Oslo, Norway; J. W. Meredith, Manchester, England, and Raoul Perciras, Havana, Cuba, and Hermann J. Muller, Sc.D., Indiana University, Bloomington. Dr. Merrill Sosman, Boston, will give the annual society lecture.

International Congress of Radiology.—The next International Congress of Radiology will be held in London in the summer of 1950, under the presidency of Dr. Ralston Paterson, Manchester. The officers for the congress are: President, Dr. J. Ralston Paterson, Manchester; president emeritus, Dr. Alfred E. Barclay, Oxford; treasurer, Dr. H. Graham Hodgson, London; secretary-general, Dr. John W. McLaren, London. All recognized radiologic societies are being asked to supply a list of their members, and full details will be sent to each radiologist and published as soon as possible. An office for the congress has been established at 45 Lincoln's Inn Fields, London, W.C. 2.

Horace Wells Memorial Volume.—A 500 page book, "Horace Wells, Dentist; Father of Surgical Anesthesia," edited by Dr. William J. Gies, Columbia University, New York, will be ready for sale and distribution some time this month. As a centenary commemoration, the volume preserves and clarifies the origination and evolution of general surgical anesthesia. It presents the "proceedings of the centenary commemoration of Wells' discovery in 1844 and lists of Wells memorabilia, including bibliographies, memorials and testimonials." It may be obtained from Dr. Eugene M. Clifford, chairman, Horace Wells Centenary Committee, 57 Pratt Street, Hartford, Conn.

Control of New Synthetic Drugs.—The General Assembly of the United Nations on October 8 unanimously approved a draft of the protocol for the control of new types of synthetic drugs that have been discovered and manufactured since 1931. The document will be submitted to the various governments and will become effective thirty days after twenty-five or more of them have approved it. The signers must include, according

to the *New York Times*, at least five of the group of nations that signed the 1931 convention for limiting the manufacture and regulating the distribution of narcotic drugs at the League of Nations in Geneva. While it is believed that the governments of the fifty-eight member states will sign the protocol, the document can be renounced after five years "by an instrument in writing deposited with the Secretary General of the United Nations."

Quincy Kiwanis Foundation.—Dr. Harold Swanberg, Quincy, Ill., editor of the *Mississippi Valley Medical Journal*, has set up a trust, organized not for pecuniary profit, that will enable the Kiwanis Club of Quincy "to sponsor, undertake, or aid in one or more things of, a charitable, scientific, literary, or educational nature, which will bring public honor and respect to Kiwanis." This trust is being administered by a board of trustees, at least one of whom must be a physician. Contributions may be made by an individual to the foundation, which the trustees have named the "Swanberg Kiwanis Foundation." Dr. Swanberg, who contributed \$1,000 to the foundation and has agreed to make further contributions as income permits, is the only member of the Kiwanis Club of Quincy who has twice served as club president. The trustees have approved a hearing conservation program for school children of Quincy and Adams County as the first project of the foundation.

Executive Director of National Health Council.—Dr. Thomas D. Dublin, professor of preventive medicine and community health, Long Island College of Medicine, has been appointed executive director of the National Health Council, a nonprofit organization of national voluntary health agencies. Its aim is to prevent diseases and maintain health through a common plan of action of its members and the development of a widespread citizens' participation in health measures. Dr. Dublin, a graduate of Harvard Medical School, received his doctorate in public health from Johns Hopkins School of Hygiene and Public Health. He has served on the staff of the New York State Department of Health, has taught at Albany (N. Y.) Medical College and was a special lecturer at the DeLamar Institute of Public Health, Columbia University. The Rockefeller Foundation has made a grant of \$225,000 to the National Health Council, to be used over a three year period.

Academy of Dermatology and Syphilology.—The annual meeting of the American Academy of Dermatology and Syphilology will be held in Chicago December 4-9 under the presidency of Dr. Clyde L. Cumber, Cleveland. The principal sessions will be held at the Palmer House, with special courses in histopathology and mycology scheduled for December 4 and 5 at the medical schools of the University of Illinois and Northwestern University. Teaching clinics will be held on the afternoons of Monday, Tuesday and Wednesday. Informal discussion groups will meet at noon and at 5 p. m. sessions. Special courses in histopathology, mycology, roentgen ray and radium therapy, mucous membrane lesions, bacteriology of the skin, industrial dermatoses, specific granulomas and dermatoscleroses will be held under leaders in these various fields. Special lectures will be given on: "Certain Aspects of Blood Dyscrasias of Special Interest to Dermatologists," by Dr. Cyrus C. Sturgis, University of Michigan Medical School, Ann Arbor; "The Relation of Endocrines to Cutaneous Diseases," by Dr. Arthur A. Hellbaum and E. C. Keaty, University of Oklahoma School of Medicine, Oklahoma City.

Marriages

MITCHELL S. MATUSZKO, Amherst, Mass., to Miss Shirley Lorraine Parmington of Rochester, N. Y., June 11.

IRVIN HARRISON TRINCHER, Emory University, Ga., to Mrs. Margaret Vaughn Weatherly of Atlanta, in June.

EDWIN PEARSON PARKER III, Washington, D. C., to Miss Mary Elizabeth Neff of Richmond, Va., June 19.

WILLIS M. SPRINKLE, Marion, Va., to Miss Irma Chappell of Miami, Fla., in New York, June 27.

SAMUEL E. REITER, Sunmount, N. Y., to Miss Adele P. Seigel at Lake Placid, June 6.

JAMES J. GRACE, Montrose, Pa., to Miss Frances G. Thornton at Wilkes-Barre, June 19.

RICHARD W. HEFFNER, Cleveland, to Miss Carol Albrecht in Madison, Wis., June 20.

WILLIAM CHIN to Miss Nancy Abbott Wong, both of Washington, D. C., June 27.

JOHN E. SCHULTS, Brooklyn, to Miss Carol Saums of Garden City, N. Y., June 26.

Deaths

James Alexander Miller † New York; born in Roselle, N. J., March 27, 1874; Columbia University College of Physicians and Surgeons, New York, 1899; professor of clinical medicine at his alma mater from 1913 to 1945; specialist certified by the American Board of Internal Medicine; member of the American Trudeau Society, American Association of Thoracic Surgery, Association of American Physicians and the American Clinical and Climatological Association; a founder, past president and member of the board of directors of the New York Tuberculosis and Health Association; past president of the National Tuberculosis Association, which in May 1944 awarded him the Trudeau Medal; past president of the American College of Physicians; past president and since 1904 a fellow of the New York Academy of Medicine, serving since 1911 as a member of its committee on public relations; in 1947 received the Academy Medal as a "distinguished medical scientist in recognition of outstanding service to humanity"; during World War I he held the rank of major and served with the American Red Cross in France; for two years medical director of the Rockefeller Tuberculosis Commission in France; received the Chevalier Legion d'Honneur; in 1930 was appointed a special deputy health commissioner, serving as a consultant on tuberculosis, and later was appointed administrative consultant in tuberculosis to the city department of hospitals; in 1948 appointed to the joint administrative board of the Columbia-Presbyterian Medical Center; in a consultant physician capacity worked for many years with the tuberculosis division at Bellevue Hospital in New York, House of Rest at Sprain Ridge, Yonkers, and Trudeau (N. Y.) Sanatorium; in 1930 received the doctor of science and in 1937 the doctor of public health degree from New York University; alumni trustee, Columbia University; author of numerous contributions to medical literature on chronic pulmonary disease, particularly tuberculosis; contributor to Musser's "Internal Medicine"; died in Black Point, Conn., July 29, aged 74, of pancreaticitis.

Jennings Crawford Litzenberg † Minneapolis; born in Waukegan, Iowa, April 6, 1870; University of Minnesota College of Medicine and Surgery, Minneapolis, 1899; studied in Vienna, Berlin, London, Glasgow and Dublin; joined the faculty of his alma mater as an instructor in obstetrics in 1901, assistant professor from 1907 to 1910, associate professor of obstetrics and gynecology from 1910 to 1914, professor and head of the department from 1914 to 1938, when he retired with the rank of professor emeritus; formerly professor of obstetrics and gynecology at the graduate school; specialist certified by the American Board of Obstetrics and Gynecology, of which he had been a member; past president, vice president and in 1920 a member of the council of the American Gynecological Society; past president of the American Association of Obstetricians, Gynecologists and Abdominal Surgeons, Hennepin County Medical Society, Minnesota Academy of Medicine and Central Association of Obstetricians and Gynecologists; honorary fellow of the Washington Gynecological Society; fellow of the American College of Surgeons; member of the House of Delegates in 1924, 1925, and from 1927 to 1929, and chairman of the Section on Obstetrics, Gynecology and Abdominal Surgery, 1927-1928, American Medical Association; the Minnesota Medical Foundation recently established the Litzenberg Lecture in his honor; served on the staffs of the Nicollet Clinic, Fairview Hospital, University Hospital, Northwestern Hospital and Eitel Hospital, where he died August 15, aged 78, of coronary sclerosis.

William Hayes Breuer † St. James, Mo.; born in St. James, Mo., Oct. 19, 1876; Beaumont Hospital Medical College, St. Louis, 1898; served as president of the Missouri State Medical Association and councilor of the twenty-sixth district; president of the Phelps-Crawford-Dent-Pulaski Counties Medical Society; member of the House of Delegates of the American Medical Association in 1934, 1935, 1936 and 1937; an officer during World War I; served as mayor; formerly health commissioner of the city of St. James; affiliated with the State Federal Soldiers Home Hospital; on the staff of Waynesville (Mo.) General Hospital; served as president of the Phelps County Historical Society and for many years as president of the Chamber of Commerce; died July 16, aged 71, of coronary occlusion.

Arthur Chalmers Martin † Old Westbury, N. Y.; born in Shelter Island, N. Y., June 6, 1887; Cornell University Medical College, New York, 1908; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; fellow of the American College of Surgeons; past president of the Nassau County

Medical Society, Nassau County Surgical Society and the Nassau County Obstetrical Society; member of the Brooklyn Gynecological Society; attached to the British Army serving overseas during World War I; attached to Nassau Hospital, Mineola, Huntington (N. Y.) Hospital, North Country Community Hospital in Glen Cove and Meadowbrook Hospital in Hempstead; died July 28, aged 61, of chronic cardiovascular renal disease.

Stephen Clifford McCoy, Louisville, Ky.; born Jan. 3, 1873; Southwestern Homeopathic Medical College and Hospital, Louisville, 1901; Kentucky University Medical Department, Louisville, 1906; member of the American Urological Association and the American Medical Association; fellow of the American College of Surgeons; served during World War I; formerly affiliated with the U. S. Public Health Service; at one time on the faculty of the University of Louisville School of Medicine; on the staffs of Louisville City Hospital, St. Anthony's Hospital and St. Joseph Infirmary, where he died July 14, aged 75, of cerebral hemorrhage.

Robert Orton Moody, Berkeley, Calif.; born in Buffalo, N. Y., Oct. 18, 1864; Yale University School of Medicine, New Haven, Conn., 1894; joined the faculty of the University of California Medical School in 1901 and in 1935 retired with the rank of professor emeritus of anatomy; member of the American Microscopical Society and the American Association of Anatomists; fellow of the American Association for the Advancement of Science; in 1911 was honored with the title of Officer de L'Instruction Publique by the French government; died in the Alta Bates Hospital July 28, aged 83, of bronchopneumonia and arteriosclerotic heart disease.

James Ross Clemens, Webster Groves, Mo., born in St. Louis, Sept. 19, 1866; L.S.A., 1900, L.R.C.P., London and M.R.C.S., England, 1901; professor emeritus of pediatrics at St. Louis University School of Medicine; at one time dean at the Creighton University Medical College in Omaha; member of the American Medical Association; served during World War I; in 1935 winner of the prize for play offered by One-Act Theatre in London, England; in 1937 received second prize from the Oxford University Press for plays suitable for English schools; died in St. Mary's Hospital, St. Louis, July 18, aged 82, of heart disease.

John Barr McAlister † Harrisburg, Pa.; born in Carroll County, Md., Jan. 31, 1864; University of Pennsylvania Department of Medicine, Philadelphia, 1887; member of the House of Delegates of the American Medical Association in 1909, 1914, 1928 and 1931; fellow of the American College of Physicians; past president of the Medical Society of the State of Pennsylvania, Dauphin County Medical Society and the Harrisburg Academy of Medicine; for many years affiliated with Harrisburg Hospital; chairman of the board of trustees of the Gettysburg (Pa.) College; died July 22, aged 84, of chronic nephritis and uremia.

Frederick William Krueger, Jacksonville, Fla.; born in Hille, Westphalia, Germany, Oct. 17, 1896; University of Nebraska College of Medicine, Omaha, 1926; served during World War I; member of the American Association of Industrial and Railway Surgeons and the Florida Association of Industrial and Railway Surgeons; on the staff of St. Luke's Hospital; a member of the visiting staffs of St. Vincent's, Brewster and Duval County hospitals; trustee, Newberry College, Newberry, S. C., and the Florida Naval Academy, St. Augustine; died July 6, aged 51, of acute coronary heart disease.

Harry Merrill Brown, Indianapolis; Indiana University School of Medicine, Indianapolis, 1939; member of the American Medical Association; served an internship and residency at the Indianapolis City Hospital; deputy coroner; a captain in the medical corps, Army of the United States, received the Bronze Star for performing outstanding services as chief of the eye, ear, nose and throat service in a hospital while a prisoner of war in Japanese Prison Camp No. 1, Cabanatuan, Philippine Islands during World War II; killed in an automobile accident, July 2, aged 33.

Eugene M. Austin, Tupper Lake, N. Y.; Albany (N. Y.) Medical College, 1887; member of the American Medical Association; for many years school physician and health officer; affiliated with the Mercy General Hospital, where he died July 21, aged 82, of multiple sclerosis, and fracture of the hip received when he fell out of bed.

Frederick Amos Baldwin, Kansas City, Mo.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1898; member of the American Medical Association; at one time on the faculty of the Baylor University College of Medicine in Dallas, Texas; died in the Research Hospital, July 13, aged 71, of uremia and prostatic hypertrophy.

Daniel Delos Comstock * Los Angeles; American Medical Missionary College, Battle Creek, Mich., and Chicago, 1905; served as clinical professor of medicine at the College of Medical Evangelists; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; from 1910 to 1917 superintendent of the Glendale (Calif.) Sanitarium and Hospital; on the staffs of the White Memorial and Los Angeles County General hospitals; died in Oakland, Md., July 30, aged 68, of coronary thrombosis.

Edwin Joseph Cornish, Dunsmuir, Calif.; Rush Medical College, Chicago, 1902; formerly affiliated with Dunsmuir Hospital; died in Southern Pacific Hospital, San Francisco, July 22, aged 73, of carcinoma of the prostate.

Hoagland Cook Davis * Baltimore; North Carolina Medical College, Charlotte, 1901; University of Maryland School of Medicine, Baltimore, 1902; fellow of the American College of Surgeons; served on the faculty of the Johns Hopkins University School of Medicine; affiliated with the John Hopkins Hospital, Sydenham Hospital, Hospital for Women of Maryland, Union Memorial Hospital, Bon Secours Hospital and the Church Home and Infirmary; died July 31, aged 69, of carcinoma.

William Insko Dean * Rochester, N. Y.; University of Buffalo School of Medicine, 1902; past president of the Monroe County Medical Society; fellow of the American College of Surgeons; veteran of the Spanish-American War; on an examining board during World War I; affiliated with the Highland Hospital, Iola-Monroe County Tuberculosis Sanatorium, Monroe County Hospital and the Rochester State Hospital; physician for the Rochester Police Department; died July 18, aged 71, of cerebral hemorrhage.

John Leonard Edmondson, Stella, Mo.; University Medical College of Kansas City, 1909; member of the American Medical Association; died in O'Reilly Veterans Administration Hospital in Springfield, July 22, aged 64, of a fungous infection.

Emile Ehler, Water Proof, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1904; died July 16, aged 69, of injuries received in an automobile accident.

Anthony William Ferrara, Callicoon Center, N. Y.; University of Vermont College of Medicine, Burlington, 1925; died July 31, aged 51, of coronary thrombosis.

Aaron Billings Gates, Greenwich, Conn.; Long Island College Hospital, Brooklyn, 1912; member of the American Medical Association and the American Society of Anesthesiologists; for many years affiliated with Greenwich Hospital; died July 9, aged 66, of coronary thrombosis.

Antonio Giorgi * Gary, Ind. (licensed in Indiana in 1911); served as a member of the board of the Central State Hospital in Indianapolis; died July 30, aged 85, of coronary occlusion.

James Goodfriend, St. Louis; Northwestern University Medical School, Chicago, 1940; interned at the Michael Reese Hospital in Chicago, where he served a residency in pediatrics; formerly a resident in pediatrics at the Cook County Hospital in Chicago; instructor in pediatrics at the Washington University School of Medicine; specialist certified by the American Board of Pediatrics; served during World War II; on the staff of St. Louis Children's Hospital; died July 5, aged 34, of heart disease.

William Augustus Harris, Savannah, Ga.; College of Physicians and Surgeons, Boston, 1905; served during World War I; superintendent of the Charity Hospital; died July 21, aged 70.

Calvin McCoy Harrison, Dallas, Texas; University of Louisville (Ky.) Medical Department, 1885; died June 6, aged 88, of coronary insufficiency.

Vernon Garold Jeurink * Denver; University of Colorado School of Medicine, Denver, 1927; secretary of the American Proctologic Society, of which he was president-elect; fellow of the American College of Surgeons; specialist certified by the American Board of Surgery; affiliated with Children's Hospital, Denver General Hospital and St. Luke's Hospital, where he died July 6, aged 45, of bronchogenic carcinoma.

Walter Frederick Johnson * New York; Jefferson Medical College of Philadelphia, 1924; member of the Medical Society of the State of Pennsylvania; specialist certified by the American Board of Ophthalmology; on the staff of the New York Eye and Ear Infirmary; died July 13, aged 49, of coronary sclerosis.

Thomas Alfred Jones, Menard, Ill.; Marion-Sims College of Medicine, St. Louis, 1897; member of the American Medical Association; served as superintendent of the general hospital and head of the medical department of the Southern Illinois Penitentiary; died in Evanston, July 3, aged 79, of carcinoma of the sigmoid.

Harry Katz, New York; University of Illinois College of Medicine, Chicago, 1916; served during World War I; died in Michael Reese Hospital, Chicago, July 20, aged 54, of lymphosarcoma and pneumonia.

Robert Floyd Lamberton * Denver; Cleveland Homeopathic Medical College, 1903; an Affiliate Fellow of the American Medical Association; served during World War I; died in St. Joseph's Hospital July 12, aged 69, of carcinoma of the prostate.

Alfred Joseph Mascia, New York; Columbia University College of Physicians and Surgeons, New York, 1945; interned at Morrisania City Hospital; certified by the National Board of Medical Examiners; entered the medical corps, Army of the United States, in April 1947 as a first lieutenant; service terminated in December 1947 with the rank of captain; died July 18, aged 27.

William Houston Moore * Wilmington, N. C.; Jefferson Medical College of Philadelphia, 1910; past president and for many years a member of the state board of medical examiners; past president of the New Hanover County Medical Society; served as councilor of the Third District of the Medical Society of the State of North Carolina; member of the city planning board; for many years a member of the city-county consolidated board of health; affiliated with the James Walker Memorial Hospital; died July 23, aged 68, of heart disease.

James A. Morford, Grantsville, W. Va.; University of Louisville (Ky.) Medical Department, 1909; county health officer; served as a member of the Calhoun County Court and one term as a member of the West Virginia House of Delegates from Calhoun County; member of the board of directors of the Calhoun County Bank; died July 21, aged 67, of circulatory failure, secondary to cerebral hemorrhage.

Victor Campbell Myers, Lansing, Mich.; Creighton University School of Medicine, Omaha, 1940; assistant director, Bureau of Industrial Health, Michigan Department of Health; killed July 30, aged 34, in an automobile accident.

Gussie Annice Niles, Salem, Ore.; University of Oregon Medical School, Portland, 1935; member of the American Medical Association; secretary of the Marion-Polk Counties Medical Society; affiliated with the Salem Deaconess Hospital; died July 9, aged 52, of cerebral hemorrhage.

Major Norvel Pannell, Philadelphia; College of Physicians and Surgeons, Boston, 1906; for many years affiliated with the Frederick Douglass Memorial Hospital; on the staff of Phipps Institute; died July 8, aged 70, of endocarditis.

Frank Adrian Pearl, Los Angeles; Howard University College of Medicine, Washington, D. C., 1912; served during World War I; died July 24, aged 61, of cerebral thrombosis.

Bruce Reed Pearson, Salt Lake City; Stanford University School of Medicine, San Francisco, 1932; member of the American Medical Association; specialist certified by the American Board of Internal Medicine; served during World War II; on the staff of St. Mark's Hospital; died July 16, aged 44, of heart disease.

Earl Fray Peinert * Columbus, Ohio; Ohio State University College of Medicine, Columbus, 1916; served overseas during World War I; for many years affiliated with St. Francis Hospital and Grant Hospital, where he died July 8, aged 57, of arteriosclerotic heart disease.

John Lee Riley, Snow Hill, Md.; University of Maryland School of Medicine, Baltimore, 1905; served as a member of the county board of education, as county jail physician and deputy medical examiner for Worcester County; a medical examiner for the Selective Service during world wars I and II; formerly a member of the board of medical examiners; president and director of the First National Bank and for many years director of the Snow Hill Building and Loan Association; died July 24, aged 73, of carcinoma of the colon.

Charles Wallace Sale * Colonel, U. S. Army, retired, Fredericksburg, Va.; University College of Medicine, Richmond, 1907; fellow of the American College of Physicians; in September 1917 entered the medical corps of the U. S. Army as a first lieutenant; promoted through the various ranks; in August 1937 became a lieutenant colonel and in August 1943 a colonel; served during world wars I and II; retired May 31, 1946 for disability in line of duty; died in the Mary Washington Hospital July 9, aged 63, of cerebral hemorrhage.

Clyde Wilfred Sample, Wilkensburg, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1903; served during World War I; on the staffs of Homeopathic Hospital and Shadyside Hospital, where he died July 19, aged 70, of coronary occlusion.

Harry Edward Schilling, Cincinnati; Miami Medical College, Cincinnati, 1909; died July 4, aged 74.

British Commonwealth Medical Conference

Doctors from all parts of the British Commonwealth met at the House of the British Medical Association to discuss the formation of a British Commonwealth Conference. Most of them had attended the meeting of the World Medical Association at Geneva, but the proposed conference is in no way an offshoot of this. There is already a close medical connection between Britain and the Dominions. From the most distant parts doctors come here for postgraduate training. The Dominions have branches of the British Medical Association or form national medical associations affiliated with it. But these connections have grown up spontaneously, without any attempt being made to incorporate the various bodies into one organization. For two days the means of promoting greater cooperation were discussed by representatives of the national medical associations of Australia, Canada, Ceylon, Eire, Great Britain, India, New Zealand, Pakistan, South Africa and Southern Rhodesia. It is proposed that an annual conference of representatives of national medical associations be held in conjunction, when possible, with the annual meeting of the association of the host country. It is proposed that the conference should last three days and that two representatives from each country should attend. The first meeting is to be held at Saskatoon, Canada, in June 1949, to be presided over by Dr. J. F. C. Anderson, president-elect of the Canadian Medical Association. In 1950 it is hoped that the conference will be held in Brisbane, Australia, and in 1951 in South Africa.

The inclusion of India and Pakistan in the conference is particularly interesting. They have exercised the option given to them to become independent, instead of a Dominion, of the British Commonwealth. But they owe modern medicine entirely to Britain, which established medical schools where 60,000 Indian graduates have been trained. At international conferences the fluent command of the English language by Indians has been noteworthy. They come to Britain in increasing numbers for postgraduate instruction. India may feel satisfaction at her political independence, but for modern culture she remains dependent on Britain. Nowhere is this more obvious than in the case of medicine. She continues to publish medical journals in English. If, as some imagine, the English language is destined in time to become the language of the world, it is exhilarating to think that medicine will play no small part in its diffusion and in the cementing of international relations.

Unexplained Deaths While Bathing

A doctor wrote to the *Lancet* (2:312 [Aug. 21] 1948) a letter giving his experience as an explanation of some of the unexpected deaths which occur during bathing. While in his bath he felt as if he were suddenly cut nearly in two by something from behind. For ten minutes he lay in the bath paralyzed and nearly fainting with pain. Had he been in deep water he certainly would have died. This letter evoked one from Dr. F. Parkes Weber, a well known authority on rare diseases, who gave a very different explanation of such deaths (*Lancet* 2:396 [Sept. 4] 1948). He said that there has often been uncertainty about the cause of deaths while bathing and that those who have recovered from an attack which apparently would have been fatal, had it occurred while swimming in deep water, can help to throw light on the subject, as the preceding correspondent has done. He cites the personal experience of a

German writer, Dr. J. P. zum Busch, which suggests that a kind of giant urticaria and faintness following immersion in cold water may be explained by the release of a histamine-like substance in the skin and subcutaneous tissue, which, if too much gets into the general circulation, may cause fainting. He refers to the teaching of Langdon-Brown: "Every known protein contains histidine. Break off a single carbon dioxide molecule from this histidine and it becomes a powerfully toxic substance, histamine. This substance when liberated from the tissue cells can produce all the phenomena of allergy." Histamine applied to the skin promptly raises an urticarial wheal. Injected subcutaneously into animals it produces a condition like anaphylactic shock. But the problem remains how a substance toxic to all becomes liberated in the tissues of some in answer to stimuli quite harmless to every one else.

Damages for Meningitis Following Spinal Anesthesia

In April of last year the High Court awarded damages of \$48,000 to a young man who contracted meningitis after a spinal injection of nupercaine hydrochloride and was left with permanent paralysis of both legs and incontinence of urine. The damages were given against the Portsmouth Corporation, in whose hospital the operation took place, but a simultaneous claim against the practitioners concerned was not granted. The corporation appealed against the verdict on the grounds that the judge had disregarded the evidence that infection with *Pseudomonas pyocyanea* could have occurred in spite of proper precautions to prevent this.

Giving judgment in the Court of Appeal, Lord Justice Bucknill said that there was sufficient evidence that the plaintiff's injury was due to an injection of nupercaine hydrochloride into the spinal canal. This introduced a bacillus which caused meningitis. The disease was due to negligence and breach of duty by the corporation's servants in failing to carry out proper antiseptic precautions. There was no satisfactory evidence that the syringe had been sterilized in accordance with the usual practice obtaining in the hospital. He therefore dismissed the appeal.

THE NETHERLANDS

(From Our Regular Correspondent)

Sept. 27, 1948.

Historic Days

The Dutch medical journals reflect the historic events of these days: Queen Wilhelmina's jubilee, Her Majesty's abdication and the inauguration of Queen Juliana. They gratefully remember the warm interest shown by the members of the royal family in public health and medical care.

Editorials point out that during the reign of Queen Wilhelmina the population nearly doubled and the general mortality, tuberculosis and infant mortality were among the lowest of the world.

Professor Van Loghem, chief editor of the leading Dutch medical journal, the *Nederlandsch Tijdschrift voor Geneeskunde*, emphasizes that public health is the outcome of many forces: the average standard of living in Holland has very much improved, especially since World War I; illiteracy gradually disappeared; as a result of social insurance against invalidism, illness, accidents, unemployment, pauperism and intemperance ceased to be problems; before the war the standard of housing became rather high; there was a rapid development in the field of industrial hygiene, and the "Cross-Societies" did excellent work for the organization of medical prevention.

In Holland tuberculosis mortality showed itself an exceedingly sensitive reactor to prosperity, especially nutrition. Even during World War I, when the Netherlands did not suffer from hostilities, the number of cases of tuberculosis increased because of the relative scarcity of food.

The figures of infant mortality in Holland were remarkably low before World War II. In fifty years they had come down from 16 to 3.4 per cent (1939). During the first years of the war they did not react to war conditions; even in the impoverished Dutch family the baby was safe. During the terrible winter of 1944-1945 there was a sharp increase in infant mortality; but, even at its height, it remained far below the average of fifty years ago.

In these historic days the improvement of health in the Dutch Indies during half a century of Dutch colonial government is mentioned more than once. During the week of festivities the Indian (formerly Colonial) Institute in Amsterdam—itsself a center of scientific activities—organized a large meeting of scientific workers in the colonial field.

Professor Swellengrebel, malariologist, gave an impressive sketch of the development of tropical hygiene, sanitary organization and medical care on Sumatra and Java. The cause of beriberi was discovered by Eijkman in the Institute of Pathology in Batavia, and in the same Institute Grijns founded vitaminology. The campaigns against smallpox, plague, malaria, ancylostomiasis and yaws are internationally recognized as object lessons in epidemiology. The hygienic experiences and experiments in the tobacco and rubber plantations on Sumatra eliminated the tropical climate as a factor of disease and proved that even a collectivity of Chinese coolies may reach an European level of public health.

Professor Swellengrebel also mentioned the development of Javanese colonizations on Sumatra before the war. Their sanitary conditions had reached a high European standard. Not only were they characterized by good hospitals and special measures against special diseases, but they were also provided with all that was necessary for hygienic environment (housing, drinking water, sewage and food) and submitted to a system of medical prevention (including antenatal care, baby clinics, compulsory treatment of school children).

At the same time the Civil Medical Service was reorganized as a Public Health Service by Dr. De Vogel. The new organization decentralized medical care, and exploration and prevention were the first items on its central program.

The Point of View of Forensic Doctors

At the Lausanne International Congress for legal medicine last May, as a consequence of a communication of Professors Delay and Desclaux, a commission was appointed and has proposed to this society the following resolution: "That the use of methods of investigation of the subconscious, such as pharmacodynamic explorations with pentothal, be, in principle, authorized in legal medicine, with a purely medical aim and as a mean of diagnosis. But the expert shall not take into consideration the revelation obtained on the materiality of facts under the influence of those substances. In this manner, the establishment of the responsibility will not, in any case, be based on this examination only, the interpretation of which demands a critical analysis by the expert doctor. Moreover it is recommended to make use of these methods only when current means of investigation have failed." Professors C. Richet and H. Desoille, commissioned by the General Assembly of deported and interned doctors of the Resistance, have given another opinion to the Society for Legal Medicine. They declared as inadmissible the exploration of the subconscious of an accused, whom the French law presumes to be innocent, with the help of pharmacodynamic means of the pentothal sodium® type. They protested against such methods in the name of their comrades who fought for individual liberty and who were subjected to the Gestapo methods of interrogation.

Franco-British Convention on Social Security

Mr. J. Griffiths, British Minister for Social Insurances, and Mr. Daniel Mayer, French Minister for Labor, signed on June 11 a convention establishing the reciprocity of the social security services between Great Britain and France. As from July 5, all contributions paid either in France or in Great Britain are taken into account in the other country, and will permit the patient to receive allowances for illness, inability to work, maternity and occupational accidents; it entitles him, according to cases, to a superannuation or widowhood pension, and this either in France or in England. Up to the present, when a British laborer came to work in France, or inversely, he lost the rights acquired in his original country by the contributions paid to the respective social insurance fund. As to the superannuation pension, and according to the new convention, each of the two countries will be responsible for the payment of a part of the pension in proportion to the period during which contributions shall have been paid to its own insurance system. The convention comprises special provisions for British officials on duty in France and vice versa.

BRAZIL

(From Our Regular Correspondent)

SÃO PAULO, Oct. 4, 1948.

Study of 1,000 Cases of Dementia Paralytica

The first group of patients with dementia paralytica admitted to the Hospital Juqueri, a state hospital near São Paulo, was studied by Drs. Cyriaco Amaral Filho and Waldemar Cardoso. The average age at the time of infection was 23 years and 3 months and at the onset of dementia paralytica was about 38 years and 5 months. The incubation period among 373 known cases varied from five to twenty years; the average incubation period was fourteen years and five months. The older the patient at the time of infection the earlier was the onset of the dementia paralytica.

In treatment, *Plasmodium vivax* was used, administered intravenously. Receptivity to *P. vivax* was about 90.0 per cent among whites, 76.3 per cent among mulattoes and 30.4 per cent among Negroes. The incidence of improvement following treatment was about 36.0 per cent, recorded as follows: complete recovery, 14.1 per cent; social recovery, 13.0 per cent, and improvement, 8.7 per cent. The total mortality rate with malaria therapy was 10 per cent; in prodromal cases, the minimal rate of 1.8 per cent was found, the major incidence occurring in the confusional variety with 15.8 per cent of deaths.

The results of treatment with malaria were better when the duration of the illness had been short. Thus, prodromal cases reached the remarkable rate of 81.0 per cent of recoveries; in patients ill less than six months, the total incidence of recoveries was about 50.0 per cent. The expansive form of the disease showed the best results, while the confusional form was less affected by treatment.

Negroes were the least benefited by malaria treatment, which is due to their natural immunity against infection with *P. vivax*. Their incidence of recoveries did not exceed 20.0 per cent, while that of white patients reached 41.0 per cent. The therapeutic results were best after 11 to 13 paroxysms. Patients who were uninfluenced by malaria were then treated with pyrethotherapy, with an incidence of 30.0 per cent of good results. Pyrethotherapy was also carried out in cases in which malaria inoculation failed to induce a sufficient number of paroxysms. Normal cerebrospinal fluid was found in 1.0 per cent of 514 cases studied. The coincidence of a positive Wassermann reaction in both the cerebrospinal fluid and the blood serum was found in 95.3 per cent. Reversal to normal cerebrospinal fluid reactions occurred only after one year of treatment, while clinical improvement was evident after a few months of treatment. The total incidence of deaths was about 53.0 per cent, one half of which occurred within the first six months after admission.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Medical Practice Acts: Federal Court Jurisdiction Over Matters Already Determined by State Court.—The New Jersey chiropractic association, and an individual chiropractor, and the New Jersey naturopathic society, and an individual naturopath, in two separate suits against the state board of medical examiners and the Attorney General of New Jersey, sought to have a declaratory judgment entered adjudicating as unconstitutional certain portions of the New Jersey medical practice act. The plaintiffs also sought a temporary injunction to stay certain criminal proceedings against the individual plaintiffs until the issues were determined and asked that a three judge court be convened to enter the temporary injunction. The defendants moved to set aside the service of the summons and the complaints and to dismiss each of the causes thereof. A consolidated argument on behalf of all plaintiffs was reduced to one brief, the defendants filed a brief covering both cases and the plaintiffs submitted a consolidated reply brief. The motion was argued in the district court, D., New Jersey.

Stripped to their essentials, the court said, the allegations of the plaintiffs resolve themselves primarily into the following constitutional issues in which the plaintiffs challenge: (1) the right of the State of New Jersey to define the scope of what constitutes the practice of medicine in the manner in which it has done so, (2) the right of the State of New Jersey to control the practice of medicine by means of its licensing system, (3) the right of the State of New Jersey to determine the accreditation to and the regulation of the schools located within its boundaries concerned with instruction in the healing arts, (4) the right of the State of New Jersey to authorize its state board of medical examiners, in the manner in which it has done so, to establish the standards by which schools instructing in the healing arts will be accredited, applicants for licenses to practice the healing arts are to be rated and to initiate legal actions on behalf of the state if such regulations as established by the state board are violated and (5) the right of the State of New Jersey to try alleged violators of statutes and regulations so established without a jury.

In the absence of diversity of citizenship, said the court, it is essential that a substantial federal question be presented in order to give the federal court jurisdiction. This court is therefore confronted with the necessity in this case of determining whether the plaintiffs have raised a substantial question under the federal constitution which has not been ruled on by the United States Supreme Court, since no diversity of citizenship exists.

Decisions of the United States Supreme Court involving the same or sufficiently analogous questions as those raised by the plaintiffs in this case were then cited and discussed in some detail, and the court decided that in the light of such decisions the plaintiff's attack on the New Jersey medical practice act appears to raise no substantial question that their rights under the federal constitution are being violated. Furthermore, the court said that the State of New Jersey had established direct, positive and definite standards for the practice of medicine and the allied healing arts consistent with its police power as a state.

The plaintiffs contended that by virtue of the decision in a prior New Jersey case (*State Board of Medical Examiners v. Grossman*, 52 A. (2d) 699), interpreting the general clauses of the medical practice act denying the right to trial by jury, the State of New Jersey has deprived them of their right to trial by jury under the federal constitution. The cases cited by the plaintiffs, said the court, are inapplicable, since they refer to the right to trial by jury in federal courts where federal statutes or rules of court are involved. Where the right is invoked under a constitutional statute of a state, the court continued, it has been ruled that trial by jury may be modified by a state or abolished altogether. Again, said the court, the plaintiffs have failed to present a substantial federal question

for consideration of the court because prior decisions of the United States Supreme Court have foreclosed this subject.

The plaintiffs next attacked the New Jersey medical school licensing act which provides (N.J.S.A. 18:20-18), "No school or college shall be conducted within this state for the purpose of training or qualifying students to practice medicine or surgery or any branch thereof or any method of treatment of disease or any abnormal physical condition without first securing from the state board of medical examiners a license authorizing it so to do." This act, the plaintiffs insisted, is unconstitutional because "no schools for naturopaths or chiropractors may be maintained in the State of New Jersey. . . . They alleged that a school for instruction in chiropractic was attempted to be organized but that it had been closed as a result of activities on the part of the authorities of the State of New Jersey. They insisted that it is the right of the people of the state to be given the opportunity to study the sciences of naturopathy and chiropractic and that, since such schools are private in nature, the state has no power to interfere with such schools. On the basis of prior cases, said the court, it appears abundantly clear that a state may set reasonable standards by way of educational requirements, examinations, etc., for the determination of the qualifications of those who hold themselves out to the public as practitioners of any form of treatment of disease or abnormal physical condition. Furthermore, a state has the right to grant to an administrative body the authority to regulate those standards fixed by the statute. If it is a fact that the standards set by the State of New Jersey have so far deterred the establishment of schools for chiropractic and naturopathy, as alleged by the plaintiffs, it is equally true that no group in the field of medicine and surgery has satisfied the statute for no such college or school exists in this state. In any event, said the court, the pleadings contain no allegations that any of the plaintiffs have applied for a license to establish a school and have been denied such a permit.

There remains then for determination, continued the court, whether the complaints allege facts to constitute a cause of action under the civil rights statute. To warrant a cause of action under this statute there must be allegations of a violation or denial, under color of "any statute, ordinance, regulation, custom, or usage," of some right granted by the federal constitution. Have the defendants acted in an unconstitutional manner or have they administered the medical practice act or the medical school licensing act in an unconstitutional manner? That the arts of chiropractic and naturopathy involve the practice of certain forms of treatment of some disease or abnormalities, organic or functional, of the human body is not contested by the plaintiffs. They assert, however, that it is unnecessary in their practice to qualify themselves in such subjects as surgery, materia medica, etc., as the statute and regulations of New Jersey now generally require of all who would practice "any method of treatment of human ailment, disease, pain, injury, deformity, mental or physical condition." They contend that their form of practice should be recognized apart from the general practice of medicine and surgery and that the failure of such recognition constitutes discrimination against them which oppressively deprives them of their right to exercise freedom in offering to administer their forms of therapy to the public. The State of New Jersey through its agencies, said the court, has deemed it appropriate that everyone who desires to practice "any method of treatment of human ailment, disease, pain, injury, deformity, mental or physical condition" shall be confronted with uniform requirements regardless of what forms of therapy, he proposes to administer. There is no showing that the laws and regulations or the administration thereof have been bent to adversely affect the right of the plaintiffs in these cases or the classes some of them hold themselves out to represent. In fact, said the court, in all their details with regard to the prosecution of the individual plaintiffs, the allegations of the complaints fail to show that the defendants have acted other than they are required, if they are to properly execute the mandates of the laws and regulations they are bound to administer. As a result there is left no valid charge of purposeful or intentional discrimination and the causes of action under the civil right statute must fall.

Furthermore, the court concluded, the plaintiffs may not convert this federal court into an appellate forum to pass on the merits of legislation rather than to contest such controversies in the state court system with appeal directly to the United States Supreme Court. The federal courts are without jurisdiction to try alleged criminal violations of state statutes. The state courts are the final arbiters of their meaning and appropriate application, subject only to review by this court if such construction or application is appropriately challenged on constitutional grounds.

For the lack of a substantial constitutional question warranting exercise of jurisdiction and failure to state a cause of action or justifiable controversy within the jurisdiction of the court, the motions for a three judge court and for temporary injunctions to stay proceedings in the state court were denied and the plaintiff's complaints dismissed.—*New Jersey Chiropractic Association et al. v. State Board of Medical Examiners; New Jersey Naturopathic Society, et al. v. Same (2 cases) (1948) 79 F. Supp. 327.*

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I & II.* Various Centers, Feb., June and Sept. 1949. *Part II.* April, 1949. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2, Pa. *Part III.* Boston & New York, Nov. 9-11, Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF INTERNAL MEDICINE: *Written.* Oct. 17, 1949. Final date for filing application is May 1. *Oral.* Philadelphia, Nov. 3-5, 1948; San Francisco, date not set. Candidates not eligible for the orals cannot be promised a place in 1949. Sec., Dr. W. A. Werrell, 1 W. Main St., Madison 3, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral.* Chicago, June 1949. Final date for filing application is Jan. 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY: *Part I.* Various Centers, Feb. 4, 1949. Final date for filing application is Nov. 1. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh 1.

AMERICAN BOARD OF OPHTHALMOLOGY: *Written.* Jan. 14. *Oral.* San Francisco, March 21-24; New York, June 11-15; St. Louis, Oct. 15-19; Boston, Dec. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPEDIC SURGERY: *Part I.* Various Centers, April & May. Final date for filing application is Dec. 31. Sec., Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14.

AMERICAN BOARD OF OTOLARYNGOLOGY: New York, Spring, 1949. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PEDIATRICS: *Oral.* Atlantic City, Nov. 17-19. Sec., Dr. Lee F. Hill, 718 Royal Union Bldg., Des Moines, Iowa.

AMERICAN BOARD OF PHYSICAL MEDICINE: Atlantic City, June 4-5. Final date for filing application is March 15. Sec., Dr. R. L. Bennett, Georgia Warm Springs Foundation, Warm Springs, Ga.

AMERICAN BOARD OF PLASTIC SURGERY: Examinations are given in June and November of each year in the home town of applicants. Sec., Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF SURGERY: *Written.* Various Centers, March 1949. Final date for filing application is Dec. 1. Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: Feb. 1950. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination.* Montgomery, June 28-30, 1949. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

ARKANSAS: * Little Rock, Nov. 4-5. Sec., Medical Board of the Arkansas Medical Society, Dr. L. J. Kosminsky, Texarkana. *Eclectic Examination.* Little Rock, Nov. 4. Sec., Dr. C. H. Young, 1415 Main St. Little Rock.

CALIFORNIA: *Oral.* Los Angeles, Nov. 20-21. Sec., Dr. Frederick N. Scatena, 1020 N Street, Sacramento 14.

COLORADO: * Denver, Jan. 4-7. Final date for filing application is Dec. 18. Sec.-Treas., Dr. W. W. King, 831 Republic Bldg., Denver 2.

CONNECTICUT: * *Examination.* Hartford, Nov. 9-10. Sec., Dr. Creighton Barker, 258 Church St., New Haven. *Homeopathic Examination.* Derby, Nov. 9-10. Sec., Dr. J. H. Evans, 1488 Chapel St., New Haven.

DELAWARE: *Examination.* Dover, Jan. 11-13. *Endorsement.* Jan. 20. Sec., Dr. J. S. McDaniel, 229 S. State St., Dover.

FLORIDA: * *Examination.* Jacksonville, Nov. 28-30. Sec., Dr. Frank D. Gray, 12 N. Rosalind Ave., Orlando.

GUAM: *Endorsement.* Agaña, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam, % F.P.O. San Francisco, Calif.

HAWAII: *Examination.* Honolulu, Jan. 10-13. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu 53.

IDAHO: Boise, Jan. 10-12. Dir., Bureau of Occupational Licenses, Miss Estella S. Mulliner, State House, Boise.

INDIANAPOLIS, June 1949. Sec., Board of Medicine, Dr. Paul R. Tindall, 416 K. of P. Bldg.,

IOWA: * *Examination.* Des Moines, Dec. 6-8. *Endorsement.* Des Moines, Dec. 6. Sec., Dr. M. A. Royal, 506 Fleming Bldg., Des Moines.

KANSAS: Topeka, Dec. 15-16. Sec., Board of Medical Registration & Examination, Dr. J. F. Hassig, 905 N. 7th St., Kansas City.

KENTUCKY: *Examination.* Louisville, Dec. 13-15. Sec., Dr. Bruce Underwood, 620 S. 3rd St., Louisville 2.

LOUISIANA: *Examination.* New Orleans, Dec. Sec.-Treas., Dr. R. B. Harrison, 1507 Ithieria Bank Bldg., New Orleans 12. *Homeopathic Examination.* Baton Rouge, subject to call. Sec., Dr. F. H. Hardenstein, 715 Pere Marquette Bldg., New Orleans.

MAINE: Portland, Nov. 9-10. Sec., Board of Registration of Medicine, Dr. Adam P. Leighton, 192 State St., Portland.

MARYLAND: *Examination.* Baltimore, Dec. 14-17. *Endorsement.* At the discretion of the Board. Sec., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore. *Homeopathic Examination.* Baltimore, Dec. 7-8. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.

MASSACHUSETTS: *Examination.* Boston, Nov. 16-19. Sec., Board of Registration in Medicine, Dr. G. L. Schadt, 413 E. State House, Boston.

MISSISSIPPI: *Reciprocity.* Jackson, Dec. 6. Exec. Officer, State Board of Health, Dr. Felix J. Underwood, Jackson.

MISSOURI: St. Louis, Oct. 25-27. Exec. Sec., Mr. John A. Hailey, P.O. Box 4, Jefferson City, Mo.

NEBRASKA: * *Examination.* Omaha, June. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Building, Lincoln 9.

NEVADA: Carson City, Nov. 1. Sec., Dr. G. H. Ross, Industrial Bldg., Carson City.

NEW HAMPSHIRE: Concord, March 10. Sec., Board of Registration in Medicine, Dr. John S. Wheeler, 107 State House, Concord.

NEW YORK: *Examination.* Various Centers, Feb. 1-4. Sec., Dr. J. L. Lochner, Jr., 23 S. Pearl St., Education Bldg., Albany.

NORTH CAROLINA: *Endorsement.* Wilson, Oct. 25. Sec., Dr. Ivan M. Procter, 226 Hillshoro St., Raleigh.

NORTH DAKOTA: *Examination.* Grand Forks, Jan. 4-7. Act. Sec., Dr. C. J. Gaspel, Grafton.

OHIO: *Examination.* Columbus, Dec. 13-15. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: * *Reciprocity.* Oklahoma City, Oct. 24-25. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

PENNSYLVANIA: *Examination.* Philadelphia, Jan., 1949. Act. Sec., Mrs. M. G. Steiner, 351 Education Bldg., Harrisburg.

SOUTH CAROLINA: *Endorsement.* Dec. 6. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA: * Pierre, Jan. 13-19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

TEXAS: Fort Worth, Nov. 4-6. Sec.-Treas., Dr. M. H. Crabb, Medical Arts Bldg., Fort Worth.

UTAH: *Examination.* Salt Lake City, July. Sec., Dept. of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

VERMONT: *Examination.* Burlington, Feb. Sec., Dr. F. J. Lawliss, Richford.

VIRGIN ISLANDS: *Examination.* Charlotte Amalie, Dec. 8-9. Comm., Dr. Christian R. Moorhead, Charlotte Amalie.

VIRGINIA: *Examination.* Richmond, Dec. 3-4. *Endorsement.* Dec. 2. Sec., Dr. K. D. Graves, 30 1/2 Franklin Road, Roanoke.

WASHINGTON: * Seattle, Jan. Sec., Dept. of Licenses, Miss Virginia Witherspoon, Olympia.

WISCONSIN: * Madison, Jan. 11-13, 1949. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls, Wis.

* Basic Science Certificate required.

ARIZONA: *Examination.* Tucson, Dec. 21. Sec., Mr. Francis A. Roy, University of Arizona, Tucson.

COLORADO: *Examination.* Denver, Dec. 1-2. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver 3.

FLORIDA: *Examination.* Gainesville, Nov. 6. Final date for filing application is Oct. 25. Mr. M. W. Emmel, University of Florida, Gainesville.

MICHIGAN: *Examination.* Ann Arbor & Detroit, Jan. 14-15. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.

MINNESOTA: *Examination.* Jan., April, June and Oct. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

NEW MEXICO: *Examination.* Santa Fe, Nov. 7. Sec., Miss Marguerite Kilkenny, 110 W. Houghton St., Santa Fe.

OKLAHOMA: Spring of 1949. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

OREGON: *Examination.* Portland, Dec. Sec., Basic Science Examining Committee, Dr. C. D. Byrne, Univ. of Oregon, Eugene.

SOUTH DAKOTA: *Examination.* Vermillion, Dec. 3-4. Sec., Dr. G. M. Evans, Yankton.

TENNESSEE: *Examination.* Memphis, Dec. 30-31. Sec., Dr. O. W. Hyman, 874 Union Avenue, Memphis 3.

WASHINGTON: Seattle, Jan. Sec., Dept. of Licenses, Miss Virginia Witherspoon, Olympia.

WISCONSIN: *Examination.* Milwaukee, Dec. 4. Final date for filing application is Nov. 27. Sec., Prof. W. H. Barber, Scott & Watson Sts., Ripon.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

- Proposed Report on Educational Qualifications of Community Health Educators. Committee on Professional Education. W. P. Shepard. —p. 843.

Q Fever in Los Angeles County.—Referring to two previous outbreaks of Q fever in the United States, Shepard and Huebner say that infected cattle in Amarillo and infected calves or sheep in Chicago had been the source of human infection. Transmission to slaughter house workers had come from infected tissues and body fluids either by direct contact or by means of droplets of spattered fluids. Ticks had been rarely seen on animals in either of these locations and in Chicago cases developed not so much in workers handling hides, but rather in those coming in contact with viscera. Q fever has been found in an apparently endemic manner in the milk shed area of Los Angeles County. Most of the patients lived near or visited dairies. Serologic studies revealed that many persons who did not give histories of clinical attacks of Q fever showed complement-fixing antibodies for Q fever. Half of the dairy workers and people living near dairies showed specific antibodies. Of 130 samples of serum of cows in the area 21 showed antibodies for Q fever, some in high titer.

- *Acute Frontal Sinusitis. E. D. Johnson. —p. 165.
- Paranasal Sinuses. S. Salinger. —p. 189.

Efficacy of Sulfathiazole Gum in Reducing Bacterial Flora.—The subjects of the experiments reported by Neiman were 199 medical students, who were divided into three groups: Group A chewed one sulfathiazole gum tablet three times daily. Group B chewed one unmedicated gum tablet three times daily. Group C chewed one medicated gum tablet once daily. Each student was instructed to chew the gum tablet at least thirty minutes, preferably longer, before discarding it. Those chewing three a day were asked to chew the first tablet shortly after

arising in the morning, the second in the middle of the day and the third before retiring. Those in group C were asked to chew the one tablet shortly before retiring. A detailed record was kept of the incidence of common colds, irritational or secondary pharyngitis and infectious or primary pharyngitis. The author found a diminution in the incidence of primary streptococcal pharyngitis in persons chewing three sulfathiazole gum tablets daily. No cases of sensitization were revealed when sulfathiazole was administered locally in a gum vehicle, as determined by the so-called Leftwich test, nor were any reactions of hypersensitivity reported by the participants.

Acute Frontal Sinusitis.—According to Johnson acute frontal sinusitis is one of the most serious diseases with which the rhinologist has to cope, chiefly because of the serious complications that may develop. The most common one is osteomyelitis of the frontal bone; others are periorbital abscess, epidural abscess, subdural abscess, brain abscess and meningitis. Fortunately, frontal sinusitis is not common. Of the more than 50,000 patients seen in the outpatient department of the Los Angeles General Hospital because of diseases of ear, nose and throat, only 68 had frontal sinusitis requiring that they be hospitalized, and in only 6 of these did osteomyelitis develop. The most common causative factor of frontal sinusitis is infection of the upper respiratory tract; in 47 of the 68 cases studied this was true. In 1 case frontal sinusitis followed measles; in 1, "flu"; in 2 cases it resulted from angina, and in 1 case from allergy. In 7 cases it resulted from swimming, and in 8 cases the cause was undetermined. *Staphylococcus aureus* appears to be the predominating organism found in the cases of frontal sinusitis. Prominent symptoms are nasal stoppage and pain and tenderness over the frontal area. Local packs of heat or cold and nasal shrinkage may quickly abort the disease. However, the pain over the frontal sinus may become more intense, and swelling may occur, indicating a periosteal involvement. Pitting edema may occur over the frontal bone, extending to the hair line. It is definite then that the patient has osteomyelitis. Increased headache and rise of temperature indicate meningitis, epidural abscess, subdural abscess or brain abscess. Sulfadiazine and penicillin should be administered. If pain and tenderness persist, one should not hesitate to trephine the bone at Ewing's point. If after trephining there are headache and rise of temperature, one should immediately reopen the trephined area, enlarge it sufficiently to expose the inner table and make an opening through this table to uncover a possible epidural or subdural abscess. If penicillin and the sulfonamide drugs do not arrest the progress of osteomyelitis, heroic measures, such as removal of the frontal bone, are considered justified. The author presents 2 case histories.

Blood, New York 3:617-728 (June) 1948

- Distribution of the Rh Types in São Paulo (Brazil). F. Ottensooser, C. S. Lacaz, H. C. Ferreira and O. Mellone. —p. 696.

Exogenous Hemochromatosis.—Schwartz and Blumenthal cite histories of 5 patients who died as a result of a variety of diseases, all characterized by severe anemia for which numerous transfusions had been given, and in all of whom hemochromatosis developed. Eight similar cases from the literature are summarized. It is postulated that hemochromatosis in these patients is the end result of the deposition and subsequently irritating action of the excess amounts of iron in the parenchyma.

matous tissues. The underlying anemia and the not infrequent transfusion reactions are thought to act as predisposing factors for the development of exogenous hemochromatosis. The authors discuss the clinical similarities and dissimilarities and the differences in pathogenesis between exogenous and endogenous hemochromatosis.

Bulletin of Johns Hopkins Hospital, Baltimore

82:583-642 (June) 1948. Partial Index

*Viruses and Virus-Like Agents as Causes of Cancer: Brief Recounting and Reflection. J. G. Kidd.—p. 583.

Physiologic Studies in Congenital Heart Disease: V. Circulation in Patients with Isolated Septal Defects. J. C. Handelsman, R. J. Bing, J. A. Campbell and H. E. Griswold.—p. 615.

Viruses as Causes of Cancer.—Kidd reviews the literature on viruses and virus-like agents in relation to cancer, pointing out that it has become widely accepted that further advances in knowledge about cancer will come largely from new discoveries in one or another of the fields of intracellular physiology, chief encouragement being derived from prospects in the study of growth as a phenomenon. During the past few years its causation has been explained theoretically by analogies drawn from a number of rather distant sources. For example, from the hypothesis that plasmagens are influential in determining the structure and behavior of tissue cells, a number of authors have advanced the supposition that aberrant forms of these conjectural entities may be responsible for cancer, while from the conception that mutant plastids cause variegational diseases and viruses in plants, and from the supposition that all tissue cells harbor ultramicroscopic symbionts analogous to the intracellular "bacteroids" of cockroaches, other authors in turn have assumed that anomalous forms of those entities may cause cancer, and still other essayists have put forth related formulations having points of orientation somewhat less discernible. All of this is mere hypothesis. It is quite conceivable that the viruses may prove increasingly useful as reagents for the study of intracellular processes, both normal and abnormal.

Disappearance of Uropepsin Following Total Gastrectomy. D. C. Balfour Jr., F. W. Preston and J. L. Bollman.—p. 880.

Prepyloric Spasm Simulating Gastric Cancer.—According to Cohn and Gold persistent spasm of the prepyloric or antral region of the stomach occasionally causes difficulty in differentiation from cancer. This area is a common site for cancer as well as spasm. They present the histories of 8 patients in whom prepyloric spasm had to be differentiated from antral cancer. This was accomplished either by clinical observation or surgical exploration. In 4 cases, an organic lesion was demonstrable which could explain the confusing prepyloric spasm. In the first 2 cases, there was a benign gastric ulcer

high on the lesser curvature; in the third, a duodenal ulcer, and in the fourth, a malignant gastric ulcer high on the lesser curvature. In the other 4 cases no definite organic lesion was demonstrable to explain the prepyloric spasm simulating cancer. Psychogenic influences were deemed responsible. The authors stress that when a malignant lesion cannot be definitely excluded by all diagnostic aids, exploratory operation is indicated.

Peptic Ulcer of Esophagus.—Castleton and Dolowitz report the case of a man who began to have symptoms of stomach trouble in 1919. The present illness began on May 19, 1947, when he suddenly began to vomit blood. He continued to vomit large quantities of blood and pass numerous tarry stools. He was given several transfusions, but, despite these, each successive blood examination showed a lower hemoglobin and hematocrit reading. On the morning of May 22 he had a hemorrhage which almost exsanguinated him. At emergency surgical intervention no evidence of ulcer could be found. Three days after gastrectomy he was again taken to the operating room and an esophagoscopy was performed. An ulcer was found about 3 cm. from the cardiac orifice at a position of 11 o'clock. At the edge of this ulcer a fair-sized artery was seen spurting blood. A piece of "oxycel" was placed on the ulcer. The "oxycel" promptly turned black and the bleeding stopped. Another piece of "oxycel," rolled into a hollow tube, was inserted into the esophagus in such a manner that its tendency to unroll applied a gentle pressure to the original "oxycel" lying on the ulcer. The scope was then removed. About five weeks later esophagoscopy was again performed. The site of the ulcer was well healed with a small residual scar. The authors believe that local application of "oxycel" or some related substance may be used to control bleeding from esophageal varices as well as from ulcers.

Diagnosis of Hemochromatosis by Means of Needle Biopsy.—According to Topp and Lindert three measures are generally utilized when diagnosis of hemochromatosis is attempted: biopsy of the skin, the intracutaneous ferric chloride test and examination of the urinary sediment for hemosiderin granules in the desquamated tubular cells. In addition, more complicated procedures, such as the determination of blood iron levels and the percentage of iron retained in the body when an accurately calculated diet has been given, have been used. These tests have not been attended by uniformly positive results in known cases. Although the classical clinical features, pigmentation of the skin, enlargement of the liver, diabetes mellitus and genital hypoplasia, should suggest the condition, approximately 20 per cent of the cases lack one or more of these characteristics. One fifth of all the cases of hemochromatosis remain undiagnosed when these conventional methods are used. In an effort to obtain a greater percentage of correct diagnoses the authors employed needle biopsy of the liver in suspected instances. They report 6 cases of hemochromatosis diagnosed by this method. Liver biopsy is a reliable and uniformly accurate means of diagnosing hemochromatosis. This disease entity would be diagnosed more easily and more frequently, if this aid is utilized. Pathogenesis of this condition, as well as of other diseases of the liver, may be clarified by living tissue studies furnished by liver biopsy.

Illinois Medical Journal, Chicago

Immunization of Children with Influenza Virus Vaccine.—Dukes and Gillespie immunized 100 children with influenza virus vaccine types A and B. In the vaccinated group 42 per cent were between 19 months and 6 years of age, 50 per

cent were between 6 and 10 years of age and 8 per cent were between 10 and 16 years of age. A group similar in number and age distribution served as controls. Immunization consisted of two injections of the vaccine, 0.5 cc. at each injection, and at intervals of one week. Smaller doses were given to 14 children. The incidence of influenza in the immunized and control groups was not unlike except for the youngest age group, in which incidence of influenza was much less frequent in the immunized children. The authors were impressed by the frequency of reactions from the injections and the incidence of rather severe reactions in the younger children. Perhaps a dosage of vaccine dependent on body weight, as with typhoid vaccine, would reduce the number and severity of reactions. Further studies of larger series of children are necessary to evaluate accurately the effectiveness of the vaccine and to determine proper immunizing doses.

Roentgenologic Examination of Shoulder.—Howes and Alicandri became aware that the usual roentgenograms of the shoulder, namely, anteroposterior views with the hand in supination and pronation, are insufficient, even if taken in stereoscopic pairs. They made a study of the roentgen anatomy of the shoulder to locate more accurately the site of calcifications in the tendon sheaths of the short rotator muscles and subacromial bursa; to clarify the exact location of fractures, particularly those involving the tuberosities, and to identify and locate periosteal and subcortical zones of reaction secondary to tendon injury. To realize these aims, the authors suggest that five views be taken: (1) the patient in supine position, hand in supination, shoulder elevated on a twenty-three degree angle block to open up the articular space between the humeral head and the acromial process of the scapula and bring into profile the face for the insertion of the infraspinatus tendon; (2) the patient in supine position, hand in supination, with the central ray at 180 degrees to skirt the anterior margin of the greater tuberosity, to demonstrate the insertion of the supraspinatus tendon; (3) the patient in supine position, hand in pronation, with central ray at 180 degrees to skirt the posterolateral margin of the greater tuberosity, bringing into profile the insertion of the teres minor tendon; (4) the patient in sitting position, with central ray directed upward and medially through the axilla, bringing out the glenoid neck as well as the two processes of the scapula and bringing into profile the lesser tuberosity, demonstrating the insertion of the subscapularis tendon anteriorly and the teres minor posteriorly, and (5) patient in supine position, hand in exaggerated external rotation, tube below the table top and directed into the bicipital groove, bringing into profile the walls of the groove as well as both the greater and lesser tuberosities and further confirming localization of calcifications overlying either tuberosity. Additional views may be taken at various degrees of angulation off these standards in specific instances.

Platelet Counts in Radiotherapy.—Brown points out that with the increasing use of wide field roentgen therapy the constitutional effects of radiation have become more important than such local effects as the cutaneous reaction. In particular, the effects resulting from excessive irradiation of the bone marrow require careful attention, for unless wide field irradiation is carefully controlled a severe or even fatal anemia may develop at a later date. A review of the records of cases in which severe anemia had developed after wide field irradiation indicated that these patients often showed skin hemorrhages similar to those of thrombopenic purpura, and it was noted that these skin hemorrhages preceded in their appearance the development of the anemia. Accordingly, the effect of radiation on the platelet count was studied and the conclusion was reached that the blood platelet level is a more reliable indicator of the effect of radiation on the bone marrow than the total white cell count. By determining the blood platelet level it is possible to avoid altogether the production of partial or permanent marrow failure. The use of the platelet level in the planning of treatment is described. The relationship between the development of petechial hemorrhages and radiation-induced thrombopenia is discussed.

Forecasting Smallpox Epidemics on Climatic Data.—

Rogers shows that earlier work on forecasting epidemics of smallpox in India, based on the study of the previous rainfall and humidity, has been confirmed and extended. An extension

of the inquiry to other tropical countries indicates that in tropical countries in general with well marked dry and wet seasons, the annual decline of smallpox incidence to a low minimum in relation to high absolute humidities during the rainy season is the rule; for it is absent in equatorial Uganda with rains throughout the year, and both the monsoon period and the monthly incidence of smallpox are reversed in such a country of the Southern hemisphere as Nyassaland in accordance with the general rule. Where smallpox is endemic, increased prevalence in any year may usually be foreseen by watching the meteorologic records in time to control the expected increase to some extent by increased use of vaccination.

Relationship Between Ectoparasite and Host.—De Meillon, Thorp and Hardy gave to rabbits by mouth or intravenous injection various drugs and noted the effects on the rate of development, survival and egg-production of *Cimex lectularius*. All of the following drugs given by intravenous injection produced some adverse effect on *Cimex lectularius*: quinine dihydrochloride, quinacrine hydrochloride, tryparsamide, nearsphenamine and epinephrine. Of these, tryparsamide and nearsphenamine produced the most striking effects in allowing few bugs to reach maturity and in causing a delay in the molting time from the fifth instar to the adult stage. Oral administration of flowers of sulfur, decoction of aloes and syrup alli (B. P.) to rabbits were without effect on the *Cimex lectularius* fed by these rabbits. Experiments in which *Cimex lectularius* was reared on rats receiving a protein-deficient diet show that bedbugs develop normally up to the fifth instar but during the process of molting to the adult stage a large proportion die—death being due to herniation of the intestine and its contents through the new cuticle of the partially molted adult. About 40 per cent of bugs which manage to molt successfully to the adult stage die within a week. Egg production of adults which survive long enough to be tested is erratic but on the whole lower than normal. Normal egg production appears to be resumed after a single feed on a normal animal.

Technical Modifications Gradually Brought About in BCG Vaccination. R. Weill-Halle.—p. 409.
*Extension of Prophylaxis of Tuberculosis by the BCG Bacillus to Adolescents and Adults. A. Courcoux.—p. 410.

BCG Vaccine for Adolescents and Adults.—Courcoux points out that a large number of adolescents and adults retain a negative tuberculin reaction. Sooner or later these anergic young adults will have contact with tubercle bacilli, and this late primary infection threatens more than 1 in 3 persons between 15 and 25 years of age. Experience proves that this late primary infection may terminate in a tuberculous process. Vaccination with BCG is advisable to protect these young persons against tuberculosis. Experiments carried out in France have proved conclusive. These results were confirmed in other countries, chiefly in Sweden and other Northern countries in which BCG vaccination has been performed on a large scale. The author reports statistics on trials carried out in four nurses' schools. In these the incidence of tuberculosis among the pupils has been reduced to almost zero, whereas it was between 35 and 38 per cent in the years before the BCG vaccination was instituted. The author concludes that young persons with negative tuberculin reaction should be treated with BCG vaccine before starting to work, and they should be kept away from tuberculous contacts two months before and two months after this treatment.

Book Notices

Essentials of Public Health. By William P. Shepard, R.S., M.D., M.A. With the Collaboration of Charles Edward Smith, M.D., D.P.H., Rodney Rau Beard, M.D., M.P.H., and Leon Benedict Reynolds, A.B., Sc.D. With a foreword by Hay Lyman Wilbur, M.D., LL.D., Sc.D., Chancellor, Stanford University, Stanford, California. Fabrikoid. Price, \$5. Pp. 600, with 30 illustrations. J. B. Lippincott Co., 227-231 S. 6th St., Philadelphia 5, 1948.

This is a manual on public health presented as a condensed handbook for physicians in private practice, medical students and members of allied professions. Its purpose is stated as "to set forth the purposes and methods of public health work." This is done simply, concisely and clearly. In addition to the four authors, numerous authorities in various fields of public health and preventive medicine have served as consultants and contributors. The book begins with a chapter orienting the practice of medicine in the field of public health, and proceeds to consider environmental sanitation, communicable disease control, including tuberculosis and the venereal diseases, and other public health problems, such as maternal and child health, infant health, health of the preschool child, heart disease, cancer, mental hygiene, diabetes, conservation of vision and hearing, crippled children, dental hygiene, nutrition, housing and health, school health services, health education, occupational health and statistics.

Under each heading is a careful interpretation of the physician's relationships to the public health program. Throughout the book the author gives evidence of a wholesome appreciation of the importance of the practicing physician and an impartial willingness to concede that mistaken conduct on the part of either the private physician or the representative of the health department leads to needless misunderstanding and destructive antagonisms.

A Psychiatric and Sociologic Study of a Series of Swedish Naval Conscripts. By Martin Ekblad. *Acta psychiatrica et neurologica Supplementum 49.* From the Swedish by Grace Lundberg. Paper. Pp. 201. Ejnar Munksgaard, Nørregade 6, Copenhagen K, 1948.

The author of this monograph utilizes Swedish compulsory military training to analyze psychiatric and social characteristics of a sample of naval conscripts, 995 of whom were personally interviewed and evaluated. From what is a good sample and statistically sound, he attempts to evaluate these factors of personality, background and physical equipment in relation to the character of service performed by the entire group and certain portions of the group having identifying characteristics. The usefulness of being able to predict, in general, future performance of individuals with certain levels of intelligence and other characteristics such as criminal records, broken homes, etc., will be obvious to all who have had to select or disqualify men for military duty.

The group of naval conscripts studied is particularly uniform. All were inducted between the ages of 20 and 22 and at about the same time and place. The men are only "unqualified conscripts from the ranks," since students and other similar categories who were in an exceptional position because of earlier training were not included.

All the men discussed had physical and psychiatric examinations and were psychologically tested. Written inquiries were made in their home communities and schools concerning past performance and family background. The Swedish penal register was searched for convictions. All convictions, complaints and illnesses of conscripts while serving were analyzed.

The author divides men into two categories: (a) those with former experience as merchant seamen, and (b) conscripts without sea experience. On comparison of these two groups, the "seamen" conscripted were found to be of a slightly higher intellectual level than the "nonseamen" group. Of the two groups, however, 33 per cent of the "seamen" were classified by the author as psychopathic, as compared with only 15 per cent of the "nonseamen." This is rather remarkable, since the author points out that social maladjustment alone was not taken to be sufficient to justify a diagnosis of psychopathy; signs of abnormal personality were also required. In spite of this standard, 58 per cent of the "seamen" completed their military training without a break or any insufficiency reaction, and 87 per

cent of the "nonseamen." "Seamen" conscripts were more often delinquent, and there was a higher incidence of mentally abnormal and maladjusted persons among the "seamen" than in a corresponding group of "nonseamen."

The mental level distribution and incidence of psychopathy in the "nonseamen" is essentially the same as in the general population of Sweden of the same age group. This testifies to the validity of the sample studied.

From a study of the conscripts who completed their training without a break or without being sentenced, including conscripts promoted to the rank of "able seaman," a surprisingly large number had low intelligence test scores. The author states that a low intelligence test score with a mental age as low as 9 years is not sufficient cause, in itself, for exempting a man from service except in those cases in which other personality defects can also be demonstrated.

As a result of the study of military convictions, the author found that a single offense over a period of time does not necessarily constitute a sign of mental abnormality, whereas more than two offenses almost without exception is a sign of psychopathy. Punishment as a result of convictions is of little value except as a morale factor to other conscripts. He therefore advocates that all men convicted of an offense be seen by a psychiatrist. As a counterpart, civil delinquency in youth prior to training usually points to a personality disturbance. Those from broken homes and of illegitimate birth have more difficulty in adjusting to military life than others.

The author's tabulations show that those with the lowest grades of intelligence (mental age below 12 years) are least able to stand extraordinary mental stress during training. Yet those with only slightly below average intelligence (12 to 14 years) are as capable of standing stress as those above average intelligence. Delinquency in civil life before training was actually less in those with a mental age below 12 than those with higher levels.

Drunkenness prior to conscription had no relationship to intellectual level, although several offenses, such as multiple civil convictions, in a large measure may be regarded as a sign of adjustment difficulty.

Eighty-nine per cent of the men who completed their training without a break were mentally normal, including 8 per cent with a mental age of 11 years or below, while only 17 per cent of those sent to a psychiatrist were normal, including 5 per cent with a mental age of 11 years or below.

In conclusion, the author states that exemption from military service because of mental deficiency should be granted only when the mental age is below 9 years; that persons with severe psychopathy should be exempted; that persons with milder forms should serve because of the morale factor; that psychopaths will be weeded out if all men sentenced for a military offense are seen by a psychiatrist, and that men sentenced for a military offense should be permitted to count as military service all time spent in serving sentences inflicted in connection with military crimes.

The last of these conclusions, the opposite to present practice, stems from the feeling that only the persons with less severe psychopathy should be in service and that because of their limited usefulness they should serve their terms only as a morale factor for the other men.

Stereoscopic Atlas of Neuroanatomy. By H. S. Rubinstein, M.D., Ph.D., Director of the Alfred Ullman Laboratory for Neuro-Psychiatric Research, Sinai Hospital, Baltimore, and C. L. Davis, M.D., Professor of Anatomy, School of Medicine, University of Maryland, Baltimore. Paper. Price, \$10. Pp. 19, with 43 plates. Grune & Stratton, Inc., 381 Fourth Ave., New York 16, 1947.

This publication consists of 10 pages of description of the technic of making a gross dissection of the brain and of 43 stereoscopic views illustrative of the gross anatomy of the brain. Since a stereoscope was not available to the reviewer; it may not be possible for him to judge accurately the relative merits of these illustrations. However, to the unaided eye they are not satisfactory. Certainly any serious student could learn far more from the gross dissection of an actual brain with any one of the several modern textbooks of neuroanatomy as a guide than from a detailed study of these views. It seems unlikely that these 43 stereoscopic views would be worth \$10 to very many students.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

LIZARD AND SPIDER BITES

To the Editor:—What is the method of treatment for (1) a child or adult bitten by *Heloderma* (the Gila monster); (2) a child or adult bitten by members of the class of arthropods known as Arachnida (a) specifically by the small scorpion which has the so-called tubercle on the tip of its tail; (b) black widow spider bite?

J. Giltitz, M.D., Sacaton, Ariz.

ANSWER.—(1) The local treatment is the same as for snake-bite. *Heloderma* is found in Arizona and New Mexico chiefly, and is one of the two lizards with a venomous bite. The other venomous lizard is the beaded lizard of Southwestern Mexico. Its bite rarely is serious, because the sluggish habits of the lizard and its anatomic construction do not favor easy or abundant introduction of venom with the bite. More venom is introduced if the lizard is on its back when it bites. After biting, the lizard is often hard to dislodge. Paralysis, dyspnea and convulsions may follow. Death rarely ensues.

(2a) Scorpions belong to the order of Scorpionida in the class of Arachnida. About three hundred species are known. The tip of the tail has a prominent bulblike enlargement which carries the terminal sting, which alone is dangerous for man. In parts of Mexico and Brazil the genera *Centruroides* and *Tityus* are dangerous. In Egypt *Buthus* is especially dangerous. Tropical scorpions may be as much as 8 inches (20.3 cm.) in length, but the size of the animal is no index of its poisonous properties.

Scorpions are nocturnal, seizing spiders and large insects with their claws and stinging them to death. In the daytime they hide under buildings, boards, stones and debris, also in clothing and shoes. The symptoms of sting are first a local intense burning pain, followed by drowsiness, severe nausea, sweating and vomiting. Speech becomes difficult and oral administration of medicine may be practically impossible. A fever (up to 104 or 105 F.) ensues. Photophobia is common. Hemorrhage can occur into the intestine, stomach or lungs, and pulmonary edema may occur. Reflexes are exaggerated and convulsions may occur. Survival for three hours means a good prognosis, although death has been reported on the fifteenth day. The poison acts through the nervous system on the respiratory and cardiac centers.

Treatment should be immediate with a tight proximal ligature, free incision of the sting area and suction to remove venom. Morphine and sedatives are often necessary for the pain and to promote sedation. A drop of strong ammonia on the site of sting may help alleviate the pain, but morphine hypodermically is more reliable. The small scorpions of the Southern United States are probably never fatal in biting but may be extremely painful and give rise to constitutional symptoms. Specific antivenin is efficacious when available.

(2b) The "black widow" spider, *Latrodectus matans*, is said to have caused 400 reported cases with 16 deaths in the United States. It is found from southern Canada to South America as far south as Peru and Chile. The bite causes excruciating pain, scarcely yielding to morphine. The venom, as in cobra poisoning, is most active on nerve ends. Ten per cent solution of calcium gluconate, 10 cc., should be given intravenously or intramuscularly. Sheep or horse specific antivenin has been prepared and is said to be obtainable from Mulford or Squibb. Desensitization should be done before use of these serums. Hot applications to the site of the bite may help relieve the pain. In bites on the extremities a tourniquet should be applied, and suction used on incisions of the bite area. The spiders are common under privy seats and bites about the genitals are common.

CHEMICAL RESPIRATORY IRRITATION

To the Editor:—Is there any connection between frequent colds in the head and respiratory irritation from sulfur dioxide?

F. J. Dewane, M.D., Menominee, Mich.

ANSWER.—Chemical irritants can and do produce irritation to the nasal mucosa of such a degree as to result in symptoms of acute rhinitis. Frequent colds may follow because of persisting engorgement with stasis and obstruction. Impaired ciliary activity further predisposes to infection. Patients subjected to the fumes of chemicals are more likely to experience episodes of acute infection of the upper respiratory tract.

VIRUS X INFECTION

To the Editor:—At present in this city many cases of so-called virus X infections, characterized by high grade and prolonged fever with virtually negative results of physical examination, are occurring. The urine is normal. Blood shows a peculiar picture with high relative lymphocytosis and monocytosis. Treatment seems to be entirely ineffective, although the prognosis appears to be good. From lay sources in Great Britain I have learned that they seem to possess an efficient treatment for such infections. No further pertinent information could be obtained from these sources. Please advise.

Walter Newman, M.D., Springfield, Mass.

ANSWER.—The term "virus X infection" was coined in Los Angeles in December 1947 to designate a disease of the respiratory tract which was similar to influenza but did not give the serologic reactions of either influenza A or influenza B. Later, it was shown that this outbreak was caused by an influenza virus which has since been designated as influenza A'. Since the outbreak in Los Angeles, many infectious diseases of unknown or unidentified cause have been called virus X infections. Some of these outbreaks may have been due to an influenza virus; others most likely were not. No statement regarding the cause of the present outbreak in Springfield, Mass., has been seen. It would certainly be unusual for an influenza virus to be operating in June. No statement has been seen concerning an effective treatment in Great Britain for the so-called virus X infections. There is a vaccine for influenza A and for influenza B. These, however, were not effective against influenza A'. Since the outbreak in Los Angeles, influenza A' virus has been included in the vaccine against influenza.

RABIES

To the Editor:—Is there ground for the opinion recently offered by physicians that the Pasteur treatment is not of value in preventing rabies after a person had been bitten by a known rabid animal?

M.D., Mississippi.

ANSWER.—The statement that the Pasteur antirabic method is not of value in the prevention of rabies after bites by rabid animals is groundless. Before the method came into use, about 15 per cent of persons bitten died of rabies. Since the introduction of the method, less than 1 per cent have died of rabies. The Pasteur Institute of Southern India (founded in 1907) at Conoor and its subsidiary centers reported (Annual Report of the Directory, 1946-1947, Madras, 1947) a death rate of not more than 0.99 per cent among thousands of persons given antirabic treatment after bites and scratches by rabid animals, mostly dogs. In 1946 the rate was 0.08 per cent. While the treatment for the prevention of rabies after bites by rabid dogs or other animals may not be effective, especially in patients treated in the latter stages of the incubation period, it is the only specific method of prevention now available, and it should be used promptly and faithfully in all cases in which it may be of value.

SEDIMENTATION RATE

To the Editor:—What, if any, effect do drugs have on the sedimentation rate of the blood? I am particularly interested in the effect of acetylsalicylic acid and antihistaminic drugs, such as diphenhydramine, "amyltal" (5-isoamyl-5-ethylbarbituric acid) and ephedrine mixtures.

Francis E. Gilfoy, M.D., Cleveland.

ANSWER.—It has been demonstrated frequently that acetylsalicylic acid and other salicylates will slow the sedimentation rate of red blood cells when given to the patient in considerable dosage and will cause striking decrease in the sedimentation rate when added to the blood in a test tube. Salicylates, in general, increase the stability of suspensions of red cells in plasma. Information is not available on the other drugs that are mentioned.

ALLERGY TO VITAMINS

To the Editor:—Does anaphylaxis to vitamins occur?

M.D., Florida.

ANSWER.—Although sensitivity to vitamins has been reported in the literature, confirmation is needed before such studies can be accepted. Some of the "allergic" responses produced by vitamins may prove to be due to impurities or other extraneous factors rather than the vitamin per se. Toxic reactions to extremely large doses of certain vitamins have been reported, but these reactions are toxic rather than allergic in nature. As the occurrence of proved allergic or anaphylactic reactions to chemically pure vitamins requires further study, a categorical answer cannot be given to this question.
